MINERAL SPRINGS

AND

HEALTH RESORTS OF CALIFORNIA

WITH A

COMPLETE CHEMICAL ANALYSIS

OF

EVERY IMPORTANT MINERAL WATER
IN THE WORLD

Illustrated

A PRIZE ESSAY

ANNUAL PRIZE OF THE MEDICAL SOCIETY OF THE STATE OF CALIFORNIA, AWARDED APRIL 20, 1889

BY

WINSLOW ANDERSON, M. D. 1860-1917

Joint Editor and Publisher of the PACIFIC MEDICAL JOURNAL

Asst. Chair Medical Chemistry and Materia Medica, and Teacher of Chemistry in the Laboratories of the University of California in the Medical and Dental Departments.
Active Member of the American Medical Association, and of the Medical Society of the State of California.
Active Member of the San Francisco County Medical Society, and of the College of Pharmacy and Pharmaceutical Society.
Secretary and Member of the Alumni Association of the Medical Department of the University of California.
Member of the Board of Medical Examiners for the State of California.
Member of the National Educational Association.
Analytical Chemist to the Coroner of the city of San Francisco.
Author of
"Desiccated Human Remains;" "Adulterations in Food Products;" "Western Mummies;"
"Mortality in Diphtheria;" Morphio-Mania, Etc., Etc."

THE GOLDEN WEST

CALIFORNIA

The old Pacific harshly calls to Mendocino's shore,
But sighs at Santa Barbara's feet his love-song evermore;
The giant redwoods greeting send to orange, fig and lime,
And Siskiyou holds out a cup for wine of Anaheim.

Proud Shasta's snow-crowned head looks out to St. Helena's base,
Where Napa's vine-wrouth glory smiles in fair Sonoma's face,
Mt. Hamilton reads reverently the mysteries of the skies,
Where San Jose's wide valley-sweep in fruited richness lies.

Across the San Joaquin's broad reach of vines and waving wheat
The old Sierras pour their gold to San Diego's feet;
And northern pine and southern palm woo sea-winds from the west,
While over all a spirit broods of romance and unrest.

The rose entwines the orange tree, the sea-winds rock the pines,
And wheat sheaves lift their golden heads amid the clustering vines;
The latest glow of sunset still unfolds them evermore,
While strength and beauty stand hand-clasped upon the Western
[shore.

Carrie Stevens Walter.

PREFACE

Several years ago while visiting some of the prominent mineral springs and health resorts in this State the author satisfied himself that California possessed as valuable mineral springs as could be found anywhere in the world, and all that is needed to make them as serviceable in the restoration and maintenance of health as their famous sister springs in the East and in Europe is their further development, their chemical analysis, and the scientific administration and application of their waters.

In Europe Balneotherapy and the scientific internal administration of mineral waters have been investigated for centuries, and have proved of great benefit in the alleviation and eradication of many of the most chronic and almost intractable diseases, such as—The many chronic articular disorders, rheumatism, rheumatic arthritis, synovitis, gout, indigestion, dyspepsia, torpidity of the liver, and intestinal tract, glandular enlargement, renal affections, Bright's disease, etc., irritation and inflammation in the bladder, brickdust deposit, calculus or stone in the bladder, diabetes, blood glandular diseases, scrofulous, syphilitic and cutaneous contaminations, etc., etc.

Having obtained analyses of every European and American spring of any note, the author commenced the task of analyzing the California waters and comparing the results. For several years he has been carying on his investigations, making a great many original analyses and several supplementary ones, and he presents in the following pages the results of his labors.

It will be observed by referring to the analytical tables that the California waters compare favorably with those of the European and Eastern States, in fact many of them are almost identical in composition.

The springs of California have been alphabetically arranged, with a sketch of their surroundings, route of travel, etc., to facilitate ready reference. The analyses of the foreign and several of our local springs have been obtained from every available source that was authentic, and with each analysis has been appended the analyst's name whenever obtainable.

The article containing the mineral springs proper was read before the Medical Society of the State of California, April 20, 1889 and awarded the annual prize of the Society.

Short articles on the ancient uses of mineral springs, their classification and theory of origin, with the therapeutics or medicinal uses of the different waters have been added.

The medicinal virtues of the mineral waters and Moor baths have been dilated upon, for it is believed that they are among the most efficient auxiliaries in the treatment of these chronic disorders, providing the baths are properly and intelligently used.

The work contains the names of over two hundred California springs, with about one hundred analyses, and two hundred analyses of all the famous springs in America and abroad.

Short sketches have been introduced on the fertility and natural productions of California; its historical account; climate; comparative thermometric tables; rainfall, etc., from which it will be seen that our golden shores on the Pacific compare favorably with all the most noted health resorts, whether they be found in the Old or in the New World.

Should the author succeed in directing attention to our fountains of health and to their scientific utilization in the treatment of disease, he feels certain of their beneficial effects, and should any of the springs through his efforts prove a boon to suffering humanity, as an auxiliary remedy, an adjuvant to regular scientific medicine, then shall his labors have been amply repaid.

WINSLOW ANDERSON,

829 Broadway, San Francisco, Cal.

March, 1890.

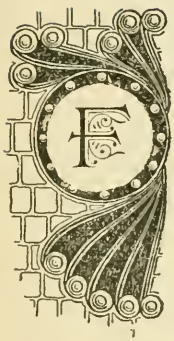
"There is a beautiful valley afar in the west,
Where orange and fig trees are grown,
Where dawnlight like Eden is flooding its breast,
And the spirit of peace is ever its guest,
Where storm and discord are unknown.

"And the stars shine down on that glen in the west
When the light of the daytime has flown;
They mirror their gleam in the river's clear breast,
While the night zephyrs whisper each blossom to rest
In the tenderest of loverlike tone."

INTRODUCTORY

Mineral Springs



ROM TIME IMMEMORIAL MINERAL WATERS have been highly valued as medicinal agents. The earliest Greek and Roman physicians admitted and advocated their efficacy in the treatment of many diseases, as may be seen from the writings of Hippocrates, Aristotle and Herodotus. Temples were erected in close proximity to mineral springs and dedicated to their healing god, Æsculapius. The ancients had recourse to the sulphurous thermal springs of Tiberias (now Tabareah), which are also extensively used at the present day by patients from all parts of Syria, for the healing of painful tumors, rheumatism and skin diseases. Josephus mentions the thermal baths of Calirrhoe, near the Dead Sea, made famous by Herod, who used them during his sickness.

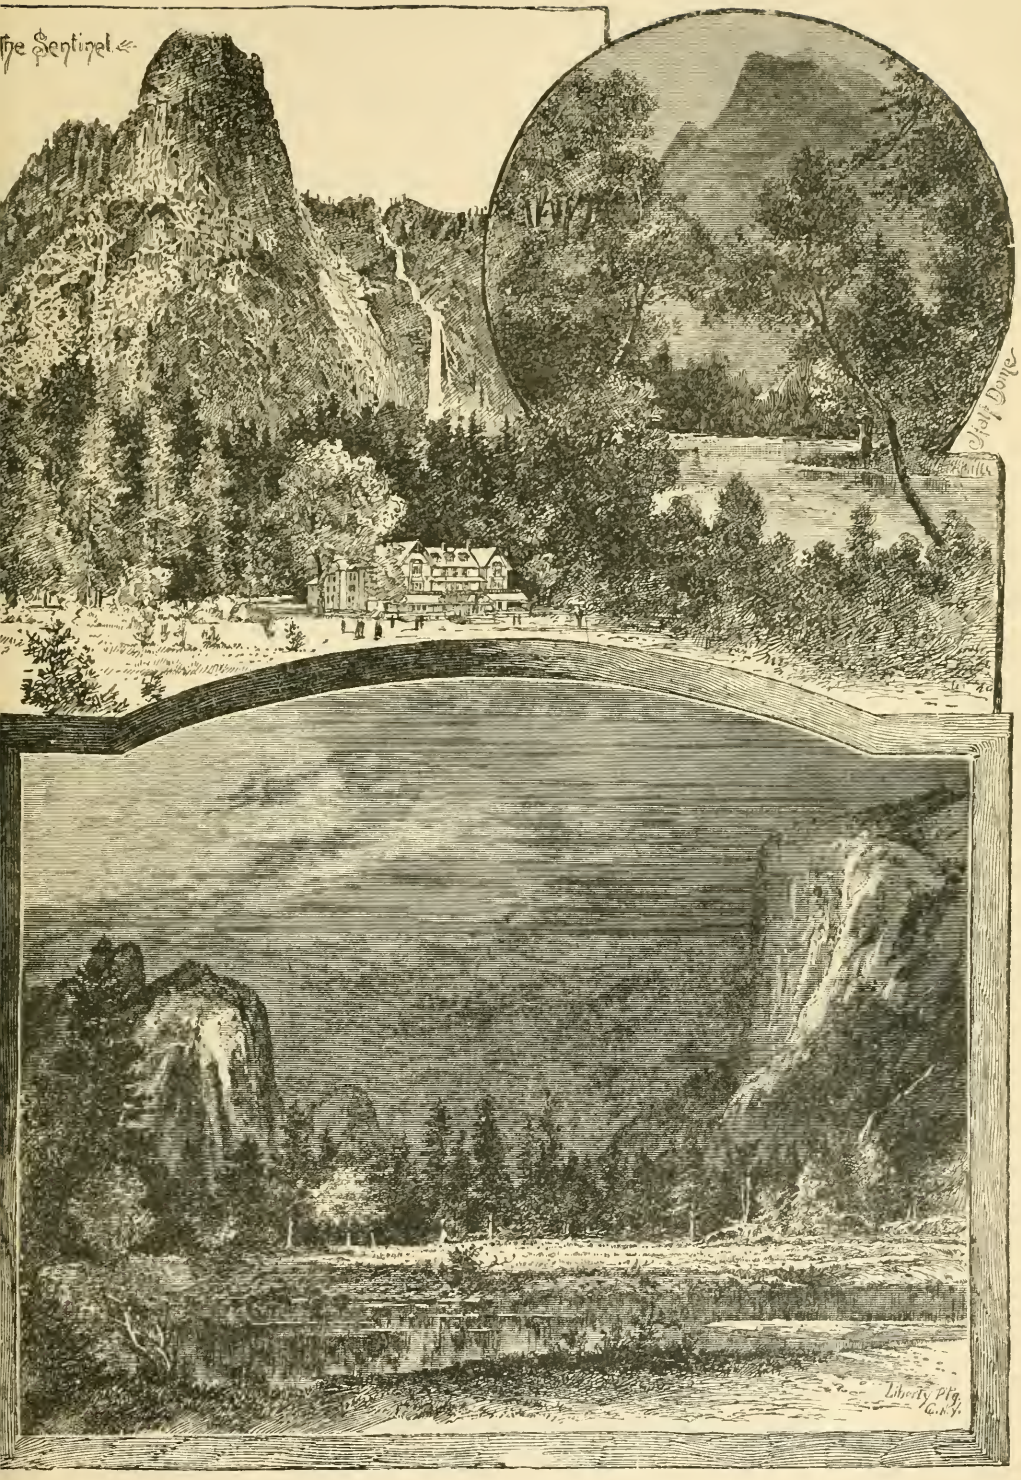
The Egyptians, Arabians and Mohammedans have used mineral waters for the healing of the sick from a very early period down to the present time. Homer frequently speaks of bathing and using the natural waters in the preparation of the sacrifice, in the reception of oracles and the holy marriages. Pliny, in his natural history, mentions a large number of mineral and thermal springs in different parts of Europe and speaks highly of their curative properties. For five centuries mineral waters were almost the only medicines employed in Rome, and the *aquæ calientes* have been in active use for drinking and bathing purposes for over two thousand years. The hot springs from which was derived the name Thermopylæ, immortalized by the heroic Spartans, have also been used for over twenty centuries for the alleviation of human sufferings. The popularity of these living health-giving

fountains has not decreased with the modern discoveries of medical science, but, on the contrary, mineral waters have become more useful and their application more extended, inasmuch as they have been reduced to scientific exactness in their mode of administration. During these two thousand years, and particularly during the last five hundred years, it has been fully demonstrated that the greatest beneficial results obtainable at these springs, for the various maladies to which they are applicable, have accrued from the scientific use of the waters and the exhibition of *judicious internal medication* at the same time, together with an adoption of the carefully prepared régime observed at the different spas, or mineral watering-places. Many of the ablest physicians of our day show their confidence in this plan of treating many of the intractable or chronic diseases, not only by going to the springs themselves when they fall victims to these disorders, as well as sending many of their patients to them, but by the fact that qualified European professors have been appointed to take charge of the mineral springs and chairs have been instituted in the medical colleges and universities, which these professors fill, by which means Balneotherapy and the use of mineral waters have become recognized branches of medical education. Students and medical men are taught the virtues of mineral waters and the practical results obtained through centuries of research at the springs in many of the German, French, Italian and English universities at the present day.

In America, and particularly in California, we cannot boast of twenty or even five centuries of continuous use of any of our mineral or thermal springs; but with this exception our mineral waters on the Atlantic Coast, in the Mississippi Valley and on the Pacific Coast can truthfully be said to be as valuable as, and in many cases, as may be seen from the analyses, almost identical with, the famous spas of Europe.

In California we have over two hundred cold and hot mineral springs, ranging from the cool, delicious, effervescent soda and sparkling vichy to the ferruginous, saline, alkaline and sulphurous wells, ever ready and overflowing, to be utilized for the healing of the "many ills to which the flesh is heir."

When our California springs become more generally known, and their similarity to the famous European spas is better understood, our invalids may not find it necessary to undertake the long, tedious, expensive, and in many instances hazardous journey, when they can find right here in California, at their very doors, as it were, almost the identical waters, with all the conveniences and luxurious accommodadations found abroad, and with the additions of a variety of food products and a pure, dry and balmy atmosphere, and an invigorating and stimulating climate unequaled in any other country in the world.



GENERAL VIEW OF YOSEMITE VALLEY

MINERAL SPRINGS

AND

HEALTH RESORTS OF CALIFORNIA

Beyond the Rockies' grand expanse
  Land of eternal Summer smiles;
Stern Winter's rude and hoary King
  Retreats before her magic wiles,
And when in olden days agone
  He came snow-laden from afar,
And scattered crystals in his train,
  And touched with frost each gleaming star,
Until he came where Summer dwells—
  What plea she made I do not know,
But this the King was vanquished here,
  And on the mountains left his snow.

Callie L. Bonney.

Origin of Mineral Springs.

The chemical and physical phenomena of natural waters have been long and carefully studied by the ablest chemists and physicists of the times. Yet the phenomena are so complex and varied, that many problems connected with this subject still await investigation. The subject is such an extensive and intricate one that we shall content ourselves with giving a brief explanation of a few of the more important topics.

In a general way a mineral spring may be defined as one yielding water impregnated to a greater or less extent with subs.ances rendering it suitable for medicinal purposes. The quantity and the kind of these dissolved substances vary greatly in different springs. To find the

cause of this variance we must look to different circumstances, such as the strata passed through by the water, and the temperature and pressure at which it exerted its solvent action upon the various mineral ingredients.

Water may almost be said to be the universal solvent. Careful experiments show that water is capable of dissolving minute quantities of those minerals most difficult of solution; even glass is soluble to an appreciable extent, as careful experiment proves. Absolutely pure water is never found in nature; even the rain from the pure skies, the purest water known, contains small amounts of dissolved oxygen, nitrogen, carbonic acid gas, ammonia, and nitrous compounds, besides small quantities of solid matter, organic and inorganic, previously suspended in the atmosphere as dust.

Formation of Mineral Springs.

A large proportion of the water that falls on the earth runs off in the streams and rivers; the rest sinks into the ground, percolating through porous places and crevices wherever it can find a way, finally reappearing at the surface in the form of springs. As water passes through the soil it comes in contact with decaying vegetable matter, which takes from it part of its oxygen, and gives up to it small quantities of organic acids and carbonic acid. Such acids, especially carbonic, increase very greatly the solvent powers of water, enabling it to attack slowly, but still effectually, otherwise practically indecomposible and insoluble substances. The carbonates of calcium and magnesium are readily dissolved; even silica and refractory silicates are slowly acted on, and their elements carried off in the water. Thus from the decomposition of igneous and metamorphic rocks, waters derive all the soluble compounds of their constituent minerals. Waters passing through sedimentary strata dissolve out many previously deposited salts. It is from such sources that salt springs derive their salt.

In volcanic regions, where secondary volcanic agencies are still at work, large quanties of free carbonie acid gas are often given off beneath the surface—its formation being in most cases probably due to the action of hot silicious solutions upon limestone, or other carbonates. Water coming in contact with this gas rapidly absorbs it, the amount varying in proportion to the pressure and inversely as the temperature. Thus at 60° F. and a pressure of one atmosphere (about 15 pounds to the square inch) water absorbs its own volume of the CO_2 gas; at 32°F. and the same pressure, nearly two volumes. And the amount absorbed is increased directly as the pressure, so that at ten or twenty atmospheres (at 60°), ten or twenty volumes of gas may be taken up; and with this increase in the gas absorbed, there is also an increase in the amounts of carbonates of lime, magnesia, iron and other salts dissolved.

When the excess of gas escapes, on the water standing long exposed to the air, the excess of salts is also deposited. In carbonated springs we often find large amounts of minerals deposited in beautifnl and fantastic forms. In rare cases waters, especially in volcanic regions, contain free acids, sulphuric, hydrochloric, or nitric. Such waters, of course, exert a most powerful solvent chemical action upon minerals, and usually soon find bases to combine with the acids.

Thermal Waters.

Water in its subterranean courses, sometimes from various causes, becomes heated to a very high temperature; often, if at considerable depths, where it is under pressure, to a point far above 212° F., the ordinary boiling point of water. Heated or superheated waters exert a powerful chemical action, being capable of dissolving many times more solid matter than when cold. When such water cools, the ingredients, which are held in solution by heat alone, are usually deposited. Such deposits may be seen at the mouths of geysers and are often quite beautiful.

Stalactites, curious and grotesque figures hanging like pendants from the roofs of caves, and stalagmites, from their drippings on the floors of caves, are formed in the same way from cold water charged with carbonate of lime.

Causes of Subterranean Heat.

There are three causes principally effective in raising the temperature of the water of thermal or hot springs. These are (1), Secondary volcanic action; (2) Chemical action; and (3) The interior heat of the earth.

Volcanic Action.

By far the greatest number of hot springs are located either in regions of active volcanic action or in regions where, although active eruptions have not occurred for hundreds or even thousands of years, the evidences of former eruptions, such as old craters and beds of volcanic rocks, may still be seen. In such regions feeble secondary phenomena, such as geysers, fumaroles and hot springs, linger on for ages to attest to the slumbering fires within. Water, percolating through the crevices of the slowly cooling rocks beneath the surface, is often heated to a very high temperature. The interesting phenomenon of hot and cold springs existing side by side is common in such regions. The waters of such springs have evidently come from different strata of the rocks or from different depths where temperatures are different. (See cold springs.)

Chemical Action.

Another source of heat of certain mineral springs is chemical action. It is well known that while some chemical reactions have the effect of producing cold, there are many that produce great quantities of heat. There are many such that may take place in mineral waters, For instance sulphur maybe oxidized to sulphur dioxide (SO, SO_2), thereby

producing considerable heat; this substance dissolves in water, forming sulphurous acid (H_2SO_3) which is capable of still further oxidation and the formation of sulphuric acid, (H_2SO_4) heat being again produced. And sulphuric acid, if it comes in contact with suitable substances, limestone for instance, or other carbonates, acts upon them with still further liberation of heat, forming sulphates.

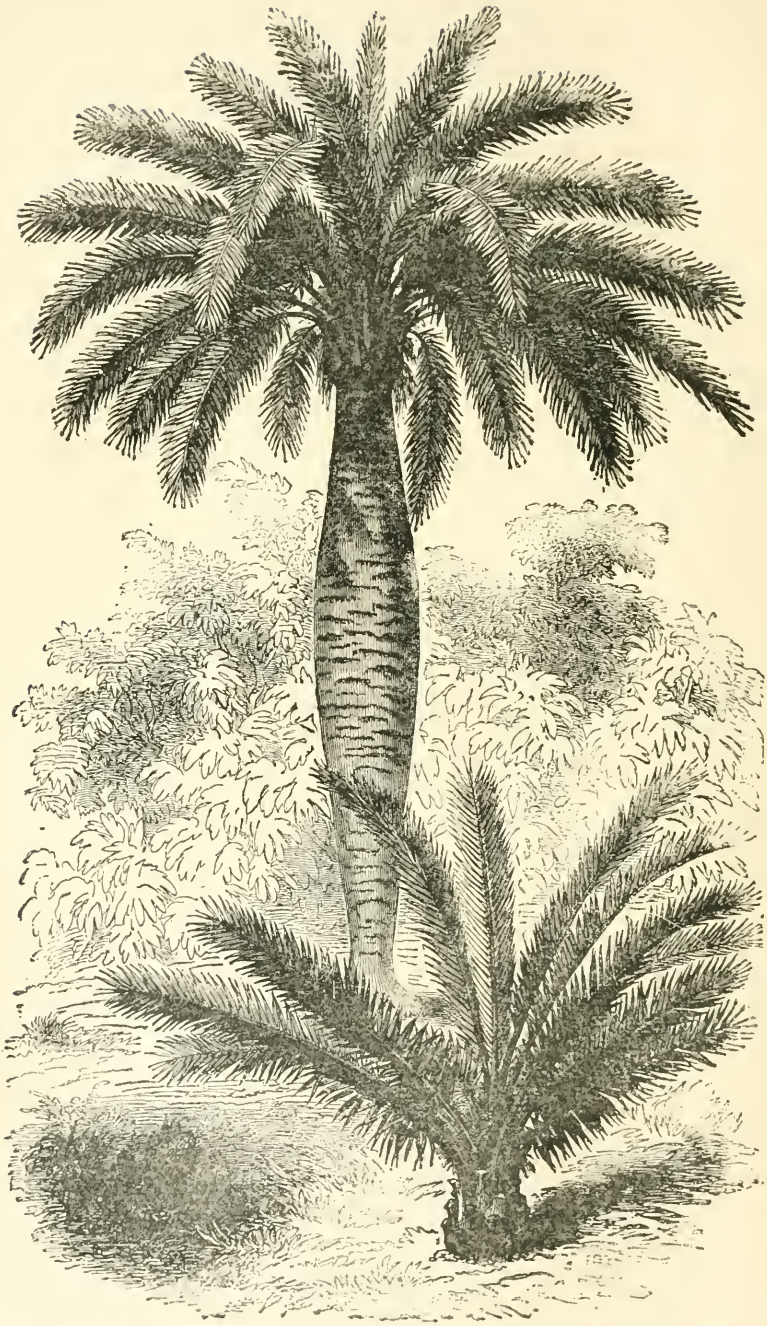
Competent authorities estimate that under favorable circumstances and in waters highly charged with certain substances chemical action may raise the temperature of water as high as even 212° F. But it is usually not a predominant cause of the heat of thermal springs, but only a subordinate one, often operating in conjunction with other causes, especially in volcanic regions.

Heat of the Earth.

Occasionally warm and hot springs are found in regions free from evidences of volcanic action. Where the elevation of temperature is not due to chemical action we must look to another cause, the universal interior heat of the earth. In the boring of artesian wells it has been demonstrated that in non-volcanic regions there is a rise in temperature of 1° F. for about every fifty-five feet of descent. Thus a spring having a temperature of 120° issuing in a locality where the mean temperature is 50° should have come from a depth of about 3,850 feet. But such estimates are not always reliable, as in many places, even where there are no signs of volcanic activity, the rise in temperature is more rapid than that mentioned, owing, probably, to the inequalities of the earth's crust.

As so many of the mineral springs of California are found in the Coast Range, it may be interesting to compare their geological history with that of the Sierra Nevada

Note.—Warm and hot springs frequently become cool for a considerable period, varying from a few days to several weeks. Recently this phenomenon has been observed in the hot springs of Salt Lake City, Utah. These springs have temperatures of 122° F. ordinarily, but for one month, in June to July of 1889, and preceding years, at irregular times, the springs became as cold as 50° F.



CALIFORNIA PALMS

range. The Sierras were upheaved at the end of the Jurassic period, at the same time as the Wasatch range four hundred miles eastward. The Coast Range was not upheaved from the ocean until long after, toward the end of the Miocene Tertiary. On this subject Professor Le Conte says:

"The Coast chain of California is a very complex system of ranges with narrow valleys between, contrasting strongly in this respect with the grand simplicity of structure characteristic of the Sierra Nevada. The Cretaceous and Tertiary strata of which it is composed are strongly folded into repeated anticlines and synclines by the lateral pressure which produced the ranges. As shown by the age of the newest crumpled strata which enter into its composition, its birth-time was the end of the Miocene. In some places the strata are unchanged and full of fossils, but in others they are intersected by dikes and overflowed by lava, and are therefore highly metamorphic. This is especially true of the region to the north of the bay of San Francisco."

Theory of Cold Springs.

Cold springs, such as carbonated waters, are formed without the aid of subterranean heat. In the mountains and on the hillsides water percolates through the soil during the precipitating season, filling up all the underground reservoirs until it reaches a clay bottom or impervious stratum upon which to rest or flow. Following the declivities the water passes through the many crevices and fissures and finds an outlet at a lower level, perhaps several miles away. During its passage through the different stratifications of the mineral constituents of the earth's crust, the water dissolves, first, some organic or vegetable matter, liberating gases, oxygen, carbonic acid gas, etc.; it next attacks the carbonates—limestone, etc.—in the rocks and becomes charged with gases and mineral ingredients from the chemical metamorphosis caused by the action of the various acidulous radicals on the baselous compounds. Hence the

composition of a spring depends entirely on the rocks and minerals through which its water permeates. Passing through large salt deposits, the spring contains quantities of sodium chloride. Filtering through iron ores, we have a ferruginous spring. Permeating limestone or marble, we have water rich in calcium salts, and so on. Rain water, as we have remarked, contains enough gaseous impurities alone to act and react on the earth's crust. To these are added the organic acids and gases from the animal and the vegetable kingdoms, and when the action has once commenced chemical evolution or reaction continues. Through these agencies the rocks and minerals are acted upon and greater or less quantities of the different mineral ingredients are held in suspension and in solution in the mineral waters.

It has been stated that certain spring waters in this State, subjected to chemical analyses, have shown larger amounts of mineral ingredients than the water could possibly hold in solution, as the saturating point of such and such an ingredient was so much, hence the analysis has been deemed incorrect. It is not the writer's desire to champion inaccurate analyses, but to call attention to the fact that as carbonic acid gas (CO_2), the great solvent power in mineral springs, is held in solution in the water *directly* as the pressure and *inversely* as the temperature, so does it increase the solvent action of the water, *pari passu* on the mineral constituents to such an extent that many thousand grains of solids may be held in solution in a gallon of water as long as the gases also remain.

BRIDAL VEIL FALLS
CASCADE FALLS

"To suffering man from Nature's genial breast
A boon transcendant ever mayst thou flow;
Blest holy fount, still bid old age to know
Reviving vigor; and if health repressed
Fade in the virgin's cheek, renew its glow
For love and joy; and they that in thy wave
Confiding trust and thankful lave,
Propitious aid, and speed the stranger band,
With health and life renewed, unto their native land."

Medicinal Uses
Of the Various Mineral Waters.

The internal administration and the external application of the natural mineral waters having been reduced to a scientific basis, it is quite important that the rules regulating their administration should be followed.

Thousands of invalids, ill-advised or perhaps wholly unadvised, seek the different springs and health resorts annually. During the author's travels among the springs of California he frequently found people whose cases were actually aggravated and the fatal termination hastened by the use of the wrong mineral waters.

Mineral springs are not "cure-alls." As a rule, too much is claimed for them. The many marvelous cures cited and the many improbable and ridiculous statements seen on printed circulars do more harm than good. Sensible people are not going to believe that a "magnetic" mineral water is going to cure a bad case of consumption, or that any "mineral water" cures heart disease, etc.

On the other hand, it would be quite as flagrant an error to suppose that all the reputed beneficial effects of mineral waters were only the result of extravagant or interested imaginings.

To obtain the greatest possible benefit from springs it is absolutely essential that the patient first consults his regular physician. A careful diagnosis should be made of his case, and then if a change of scene and a course of treatment at some spring be truly advantageous, let the physician, who is certainly the most competent to advise in such matters, recommend the resort best suited to the case. If the mineral waters and hygienic régime be used as an auxiliary to the regular internal treatment, the best results may be hoped for. Once at the springs the patient should implicitly follow the directions of the resident physician, who, if armed with a personal letter from the patient's regular physician, can prescribe wisely at once.

The indiscriminate use of mineral waters, either for drinking or bathing purposes, cannot be too strongly condemned, for while they look bland and harmless, they are potent therapeutic agents which may accomplish much good if judiciously employed, but may also do much harm and may be followed by serious if not fatal results in careless hands.

The climate here in California is conducive to the highest excellence in mental activity and physical strength. When an individual contracts a disease—rheumatism, for instance—which requires several weeks for a complete cure, he becomes restless and eager to follow his vocation. The result is that as soon as the patient is able to walk at all he commences the continuous rush of business, and neglects his disease, which gradually lapses into a sub-acute or chronic state. In this condition, perhaps, he goes to the springs. Here the same restlessness characterizes the average Californian, and, indeed, the majority of American patients. He will "rush" the treatment. If one glass of water be prescribed three times daily he will take half a dozen glasses as many times a day. If one sulphur water or mud bath be prescribed once in three or once in two days he will want to take it two or three times daily in order to hurry up the treatment.

This is not an overdrawn or an individual instance. Resident physicians have repeatedly informed the writer of the difficulty experienced in keeping patients within due bounds, and in more than one case this rushing and unauthorized self-treatment has resulted fatally in less than one week's time. And as to quick recoveries, in the majority of obstinate cases, repose, pure and simple, is the most potent remedial agent that can be employed; whilst heroic treatment only hastens the fatal moment of utter collapse. Business cares may be pressing, and of vital importance, but it is of far more importance that the fast wearing out machine be saved while there is yet time so that it may not run the risk of becoming a helpless encumbrance on the already overburdened shoulders of relatives and friends.

Therefore, let suffering humanity first seek medical advice, be thoroughly examined and carefully diagnosticated. Let the intelligent physician send the patient to the springs best suited to the individual case, and whilst there drink the waters and use the baths, and follow the regime directed by the resident or supervising physician. This plan, with judicious internal medication promises the best results.

All we need at American health resorts and mineral watering-places is to follow the natural scientific regime which has been worked out for centuries in Europe. There every patient confides in his physician, and medical men abroad value the mineral springs more, apparently, than we do in America. The patient is ordered to this or that spring for one, two or three months. He places himself entirely under the care of his family physician and the resident physician at the springs. Patients who are able to walk get up at 6 A. M. and walk to the springs, drink the prescribed amount of water and walk from one to two miles before breakfast. They take their meals regularly. Their diet is carefully regulated for each disease. They retire early, exercise freely, use the baths or drink the waters

regularly and improve twice as rapidly in Germany, France and England for the same class of diseases, and with the same—almost the identical—mineral water treatment as we use in America, simply because they follow a regular scientific system. This we hope will be done in California.

Is it not well to follow in the footsteps of the sages who have gone before? Is it not well to adopt anything we find abroad where the experience has been extended over centuries, when we know it is philosophic and conducive to our own health and welfare? A moment's reflection will convince any one how much better the European plan is than our own. We sleep until breakfast is nearly over, use the mineral water when we feel like it, exercise as little as possible, and recognize no superior in this free and independent country. A medical man is not allowed to tell one of these sovereigns that he must get up at 6 A. M. and drink the prescribed amount of mineral water and walk the necessary number of miles before breakfast; eat the regulation diet and strictly follow the *regime* best calculated to improve his disease; it would jar too much on his sensitive republican feelings. Yet this is just what American watering-places and sanitariums need. *It is the only thing our California mineral springs need* to make them as successful in this treatment of the many chronic diseases as the spas of Europe are. In the writer's travels among the different springs of California he frequently found spring owners who advised their patients to throw away all their pills, powders and potions and rely entirely on the natural product from Nature's laboratory. This is not the wisest course to pursue. Many of our local springs could be made to assist the regular scientific medical treatment. The two combined (mineral waters and medicine) will effect a cure in many of the obstinate and intractable diseases, when either taken alone may not benefit the patient so much. Mineral waters hasten the cure by assisting in the absorption of appropriate remedies as well as by their eliminating powers. Comparatively larger doses, for instance, of many blood purifying

remedies can be tolerated when taken in conjunction with mineral waters, because the medicine acts more rapidly on the disease, and is in turn more rapidly discharged from the body, carrying with it the poison from the disease under treatment.

This is the explanation of the great secret in rapidly curing chronic diseases at the springs. At the Arkansas springs, at Virginia, at New York, and at the European spas, this is their successful plan--medicine and mineral waters combined. Many a poor suffering mortal has had occasion to thank the intelligence of the medical man who first combined nature and art, and made it possible to rid the system of those serious and almost worse than fatal chronic, lingering, painful diseases by combining generous medication with natural mineral waters.

The following extract is from an editorial in the *Journal of Balneology and Medical Clippings*, A. L. A. Toboldt, M. D., and J. A. Beebe, M. D., editors, New York, June, 1889:

SANITARIUMS AND HEALTH RESORTS

It is a fact greatly to be deplored that more time and study is not devoted to the subject of mineral springs in this country, as they seem best suited to the treatment of so vast a number of cases, especially when properly directed by some physician who is thoroughly conversant, not only with the disease to be treated, but also with the mineral spring at his disposal.

It would be a grand thing for this country, and we may say for the undertakers of the enterprise as well, to build a few large hotels in a location specially suited for the purpose, on account of its healthfulness, salubrious climate, hygienic surroundings, etc., to thoroughly equip these with all the latest appliances for the various kinds of baths, not excepting the moor, or, as they are sometimes styled in the country, "mud baths." Let the place be thoroughly stocked with all the leading brands of imported as well as domestic mineral spring waters. Then let a physician be placed in charge who is thoroughly familiar with this branch of medicine, and we have no doubt but what the enterprise will receive the indorsement and support of all the more enlightened and intelligent physicians of this country. Such an institution has become a necessity, and we have little doubt but what, if not

this year, the next few years will see such an enterprise, not alone started, but flourishing. There is that so little understood disease, "diabetes." Let any patient, among the better class, be suffering from this disease and his physician at once orders him to Carlsbad. And why? Because experience has demonstrated the fact over and over again that diabetic patients get well at Carlsbad. The reason why they get well there quicker than when drinking the imported waters at home is no great secret to the profession. They know that in Carlsbad the patient at once places himself under the care of an intelligent physician who has mastered every detail of the treatment of this disease, a regular bill of fare is made out for the patient, which he adheres to as strictly as to the drinking of the Carlsbad waters. Then the fact of the patient being away from home comes in here as a very great factor, never to be overlooked. He is, by leaving home, at once removed from the probable *cause* of the disease, let this be mental overwork, worry, anxiety, grief or what not, he is placed under entirely different surroundings, and in addition to this there come the factors of a salubrious climate, systematic out-of-door exercise, regular habits, and the diet specially adapted to his disease. It is, no doubt, largely owing to these factors that the patients improve so rapidly at Carlsbad. But all these additions to the drinking of Carlsbad water can be had here as well as the Carlsbad water itself; in fact, whereas the water must be imported we already have all the necessary adjuncts, we have the climate, the hygiene, etc., the only thing we lack as yet is the sanitarium or health resort under proper management. Diabetes is only one of the many diseases that can best be reached and conquered in this way. The many diseases of the female generative organs, let them be induced by inflammations in the pelvis, severe child-bed or other causes, may also be mentioned here; that they are better treated away from home, from the cares and trials of a household or from the annoyance of officious and over-sympathetic friends, no one will question.

Then there is that host of diseases due to nervous breakdown, from overwork, anxiety, worry, grief, dissipation, etc. To attempt to treat these at home is generally a long, tedious and wearisome task, and when convalescence has but fairly started, the physician, having regard for the other members of the family, hastens to suggest travel, the seashore, mountains, etc., generally, however, not before some other member of the family is thoroughly broken down with the nursing. What a boon a properly located and equipped sanitarium would be to those patients; a place they could go to, knowing they would receive the best treatment, care and attention, instead as it is at present in this country, stay at home, wear out all the rest of the family, and either

finally succumb to the disease, or else, what seems still worse, become an invalid for life, only a fit subject for the numerous institutions for invalids.

In this category let us also mention the old liver diseases, chronic constipation, obesity, etc. The taking of these patients away from their daily tasks, their sedentary habits, compelling them to live out of doors, take properly regulated exercise, diet, etc., etc., and if their stay at such a sanitarium be ever so short, they will return home to their accustomed duties with a vim, activity and vigor they hardly deemed possible.

But enough of these examples; let us hope that at no distant day this country, so rich in every kind of institution, will not have to send her sick to Europe to be treated at Carlsbad, Franzensbad, etc., but will have as good institutions here at home, and, if Carlsbad water must be drunk, let it be drunk *here*, no necessity of having to go to Europe to get that which is already imported and at hand, and surely no one will say that we need import a salubrious atmosphere, or healthy climate; our climate is surely as good as any to be found in Europe.

SCENE IN THE SIERRAS

The Therapeutic Action of Mineral Waters on the Human Economy.

The specific action of any mineral spring must of course depend upon the chemical ingredients found in its waters. In the following classification of the various distinct mineral waters, short notes on their therapeutic action have been added. Generally speaking, mineral waters are well received and well borne by the stomach.

The following extract is from a description of Dr. Moorman, resident physician at the White Sulphur Springs in Virginia for over thirty years. He is probably the best qualified medical man in America on the special subject of mineral waters. He says, in speaking of the action of the mineral waters generally :

" Mineral waters are evidently absorbed; they enter into the circulation and change the consistency as well as the composition of the fluids ; they course through the system and apply the medicinal materials which they hold in solution, in the most minute form of subdivision that can be conceived, to the diseased surfaces and tissues; they reach and search the most minute ramifications of the capillaries, and remove the morbid condition of those vessels which are so frequently the primary seats of disease. It is thus that they relieve chronic disordered action, and impart natural energy and elasticity to vessels that have been distended either by inflammation or congestion, while they communicate an energy to the muscular fibre and to the animal tissues generally, which is not witnessed from the administration of ordinary remedies. Mineral waters also dissolve many pathological and morbific materials which are more readily eliminated from the body. They also act on the nervous system, regulating and stimulating important blood forming centers whose abnormal action is often the primary cause of deleterious changes in the blood itself. The waters are also serviceable as simple diluents, washing out

the gastro-intestinal tract, diluting the different fluids of the body, and serving as vehicles of waste products, besides having their own tonic action.

"Carbonic acid gas, although a poisonous, effete, worn out substance when eliminated from the integumentary system and pulmonary mucous membranes, laden as it is, with noxious materials, when taken in the natural mineral waters, which nearly always contain more or less of this gas, not only dissolves the one substance without disuniting the combinations of the others, but it enters the system charged with mineral particles, and presents them to the mouths of the absorbent vessels in this highly diluted condition, while at the same time it promotes their direct absorption by naturally creating a stimulating power on the vascular and nervous system. Thus you may understand why six-tenths of a grain of iron imbibed into the duodenal lacteals with abundance of the gaseous acid may exercise a greater influence on the circulating system than three or four times the quantity of pharmaceutic carbonate of iron, which has to be dissolved in the gastric juice previous to absorption."

The foregoing extract is from Dr. Sigismund Sutro of London, who is an expert on mineral waters, and whose able lectures delivered in London before the Hunterian School of Medicine, show that he has studied his subject thoroughly. Chemical experience teaches us that although a chalybeate water contains only a few grains of iron salt to each gallon, yet its tonic effect is greater than larger quantities given without the aid of the mineral water.

From the foregoing it will be observed that mineral waters act beneficially on the economy from the fact that they are easily borne by the stomach and are pleasant to drink; besides their specific action depending on the preponderance of any one or more special ingredients, the waters acts as stimulants, not only to the digestive organs, but also to the absorbing organs. By these means the fractional part of a grain of iron may become more powerful

than vastly larger quantities otherwise administered. Mineral waters also dissolve and remove morbific products and prevent their further development and deposit in the human economy.

1. Acid Mineral Springs.

There are mineral springs containing some natural mineral acid—notably sulphuric. The Oak Orchard Spring in Genesee County, N. Y., contains over 133 grains of sulphuric acid to each gallon, having only 211 grains of solid ingredients. This is perhaps the strongest acid spring in America. The Thermal Acid Springs in California contain 78 parts in 1,000 of sulphuric acid. Several other springs contain appreciable amounts of sulphuric, hydrochloric (muriatic), and nitric acids. Nearly all the cold and many of the hot springs contain carbonic acid gas. This in solution in the water forms carbonic acid. When drank at the springs, or immediately after opening, that which is bottled, it is found to be acid, but allowing the water free exposure, the gas evaporates and the water becomes alkaline and loses much of its medicinal effect (see (8), carbonated waters).

Therapeutics of Acid Mineral Waters.

These waters are highly useful in many conditions of the digestive apparatus. In atonic dyspepsia, the acids, especially hydrochloric, should be taken after meals to assist in the digestion of nitrogenous food in the stomach. Taken in conjunction with the usual concomitant mineral constituents found in spring waters, acids are important tonics in these cases taken after the meals.

In the many cases of excessive formation of acid in the stomach from the faulty digestion or fermentation of saccharine and starchy foods with the troublesome symptoms of acid eructation (pyrosis) or "heartburn," the mineral

acids and waters are beneficial, but in these cases they must be taken before meals, otherwise the waters would be increasing instead of decreasing the trouble. These acid waters are useful in the treatment of colliquative or night sweats, acting as astringents; for this purpose they should be taken before retiring. In chronic serous diarrhœa, congestion of the liver, so called "bilious attacks," jaundice, with portal torpidity, early stages of cirrhosis and chronic hepatitis, the acid waters are recommended—taken two hours after meals three times daily.

For chronic lead poisoning the sulphuric acid waters are valuable, forming insoluble and inert sulphates of lead which pass from the system.

Certain urinary disorders are much benefited by these waters, for example, the phosphate diathesis, oxaluria, alkalinity of the urine with a feeling of general *malaïse* and a loss of ambition, etc.

Mineral and acid waters are also useful in chronic catarrhal affections of the stomach and bladder, in biliary or cystic calculi (phosphatic), in fevers and certain skin diseases.

Acid baths or topical applications of the acid waters are also recommended in chronic liver and skin troubles.

2. Alkaline Mineral Waters.

The alkaline waters may be divided into three classes, viz: (a) alkalo-carbonated. (b) alkalo-chalybeate. (c) alkalo-saline.

(a) The alkalo-carbonated variety comprises a long list of cold mineral springs having carbonates and bicarbonates of sodium, potassium, etc., with a small amount of carbonic anhydride. Upon standing in the air a short time a small amount of gas evaporates. These waters are alkaline.

(b) The alkalo-chalybeate waters contain besides the carbonates of sodium and potassium, etc., carbonates (usually) or some other salt of iron.

(c) Alkalo-saline mineral waters have in addition to the alkaline carbonates, sulphates of magnesia (Epsom salts) and sulphate of sodium (Glauber's salt).

Therapeutics of Alkaline Waters.

The medicinal uses of the alkaline mineral waters are quite considerable as well as beneficial if judiciously administered as to time, quantity and quality.

The Alkalo-Carbonated Waters.

These are advised in dyspepsia with excessive acidity of the gastric secretions, with sour and disagreeable eructations and regurgitations, with flatulent distention of the abdomen. For these purposes the waters are taken after meals.

In atonic dyspepsia an acid is exhibited after meals to assist in the chymification of the nitrogenous elements of food in the stomach. Alkaline waters taken before meals will also stimulate the peptic glands into activity and thereby assist in stomach digestion. In this way these waters act as a tonic. For this purpose they are taken in moderate quantities fifteen to thirty minutes before meals.

The alkalo-carbonated waters are usually diuretic and correct any acid tendency of the urinary secretions, hence they are of great utility in fevers and rheumatism, gout, chronic arthritis, congestion and irritation of kidneys and bladder, etc.

The lithontriptic value of alkalo-carbonated waters has been established in the most conclusive way, by carefully conducted experiments at many of the celebrated spas in Europe. Many of the greatest masters of clinical medicine thoroughly indorse these waters in the treatment of calculi, gravel and gout. The waters are of special value in the cystic and nephretic calculi (urinary stones), which are made up of inorganic molecules united by crystallization or by mucous debris. Indeed, many of these little granules

are composed of a little mucous epithelium or some accidental foreign body for a nucleus, around which uric acid, carbonate of lime, phosphates of magnesia, ammonia and soda or oxalate of lime crystallize. The active determining cause appears to be urinary fermentation which produces the crystallization. In uric acid gravel the alkalo-carbonated mineral waters assist in diluting the urine and rendering it alkaline, thereby preventing the formation of calculi.

It is also claimed that these carbonated waters dissolve the uric acid calculi, transforming them into urate of soda, which is more readily soluble in the alkaline waters.

In vesical catarrh, with all the concomitant symptoms of irritation, pain, etc., the alkalo-carbonated waters have a pleasant effect.

For metritis, leucorrhœa and sterility these waters have long been in use in Europe.

M. M. Petrequin and Socquet, in their "Trait des Eaux Minerales," write as follows: "In women, alkaline waters have a complex physiological action on the uterine systems. They tend to diminish the catarrhal secretions, and the same result is observed in cases of leucorrhœa.

"As for derangement of menstruation, resulting either from chlorosis or from obstruction of the womb, they also may be combated by the same springs.

"Their influence favors conception. This is doubtless attributable to the above combination of circumstances and it is for this reason they can be prescribed in cases of sterility." (See also article on uterine douche.)

In gout these waters are highly extolled. The excessive acid condition of the blood is modified and the uric acid is rapidly eliminated.

The use of alkaline mineral waters forms the only treatment used for rheumatism in many cases and the patients recover rapidly.

In diabetes (sugar in the urine) European springs, especially the alkaline waters, have been much used. The

eminent chemist, Pelouze, expresses himself in the following emphatic way in writing to his friend, Prof. Mialhe:

"I shall not take upon myself to decide whether the theory which you sustain respecting the destruction of sugar in the system be true or false; but I can affirm that I myself have witnessed, as a result of appropriate alkaline treatment, the disappearance of sugar from the urine of many diabetic patients subjected to its action, and, moreover, in many of these cases it had not reappeared several months after the treatment was stopped, the system having, so to speak, laid in a stock of health." The salines which frequently become alkalo-salines are of much value in catarrhal conditions of the gastro-intestinal tract with chlyopoietic engorgements.

For obesity it is necessary to use large quantities of the alkalo-carbonated and alkalo-saline waters to keep the intestinal circulation well depleted. The water should be taken an hour before meals and again two or three hours afterwards, using several quarts daily. The hot alkaline baths may also be taken daily (under the immediate supervision of the medical attendant) with perfect safety and with much benefit. The diet must be carefully regulated. Nothing should be eaten that grows underneath the ground, and the starchy and saccharine foods which assist in the accumulation of adipose tissue should be sedulously avoided. Lean meats may be eaten and hot alkaline waters drank. Systematic exercise should be observed. In this way the author succeeded in reducing one female patient from 255 pounds to 180 pounds in five months, the patient at the same time enjoying perfect health.

For rheumatism and gout the alkaline springs have long had a deservedly high reputation. The water is taken in moderate quantities, six to twelve glasses daily, with its external application in the form of hot baths. In rheumatism the blood is surcharged with acids, and the alkaline waters seem to neutralize this condition.

The alkalo-chalybeate waters are especially serviceable in anæmia and lithiæmia, or the lithic acid diathesis, in "gravel" or "sand" in the urine; also in diabetes mellitis, especially when it is hepatic in origin or when it occurs in obese people. The chalybeate waters are of great service in the many diseases superinduced by a paucity of red blood corpuscles or depending on toxæmia which deteriorated the quality of the blood.

3. Alum Mineral Springs.

Several springs in California contain considerable quantities of alum.

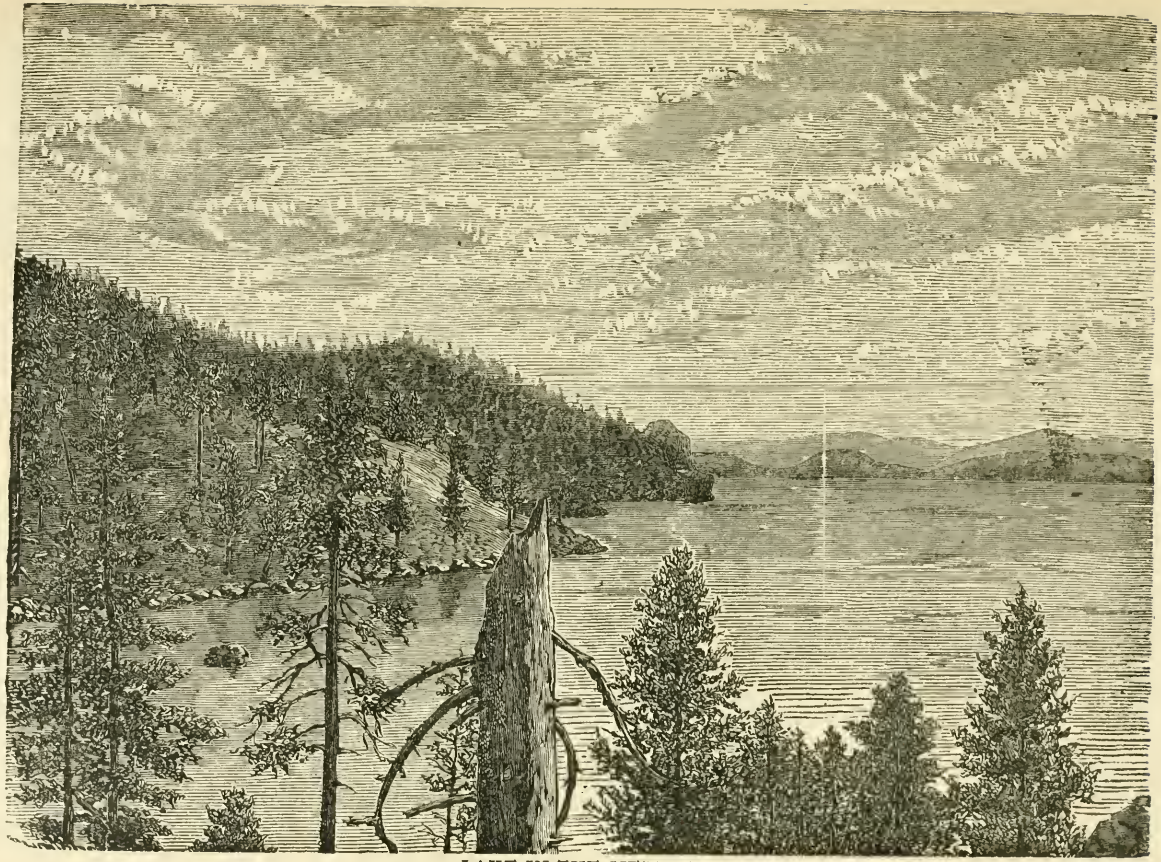
Therapeutically, as far as the alum itself is concerned, those springs are not of any special value. The waters have been used for hemorrhages and for uterine douches.

4. Arsenical Mineral Springs.

In many localities up and down the coast we find distinct traces of arsenic in combination with other elements among the mineral ingredients of springs.

THERAPEUTICS.

Arsenical waters have proved highly beneficial in irritative dyspepsia, chronic gastric catarrh, gastralgia and enteralgia. For this purpose small draughts should be taken half an hour before meals. In chronic diarrhœa and dysentery it should be taken an hour before meals or two hours after meals. Jaundice with catarrh of the bile ducts and chronic cirrhosis of the liver are improved by these waters. The waters are also highly extolled in chlorosis and anæmia, chronic malarial toxæmia, hemicrania and malarial neuralgia, and in cutaneous diseases, scrofulous sores and syphilitic contaminations. The skin diseases most benefited are the chronic scaly variety—especially psoriasis, eczema, pemphigus and old cases of acne (pimples). For these diseases the waters containing both iron



LAKE IN THE SIERRAS

and arsenic are especially serviceable, taken one hour after meals. Menorrhagia and functional impotence are also improved by a course at these arsenical and chalybeate springs, with wholesome food and free outdoor exercise.

5. Borax Mineral Springs.

Springs containing borates and borax are plentiful in California.

THERAPEUTICS.

The waters are useful for catamenial irregularities, and for cystic and nephretic calculi depending on a uric acid diathesis. In these latter cases the borax probably acts by liberating the alkali sodium, which then neutralizes the uric acid, setting free the boric acid.

The borax mineral waters have also been found very beneficial in clergymen's sorethroat, alleviating the hoarseness and curing the chronic or sub-acute inflammation of the mucous membranes and strengthening the larynx and vocal chords.

Borax waters may be drank four to six times daily between meals. Gargles may be used.

Borax forms quite an article of commerce. California produced during the last twenty years over $5,000,000 worth.

6. Bromine and Bromide Springs.

The bromides of sodium, potassium, etc., are found in considerable quantities in several of the mineral springs on the coast.

THERAPEUTICS.

Bromine mineral waters are valuable adjuncts in the treatment of rheumatism, gout, blood-glandular diseases, goitre, synovites, etc. In obesity they hasten retrograde tissue metamorphosis and lessen the bodily weight. Chronic mercurial and saturnine poisoning are greatly benefited by a course of these waters. The bromides combine with the mercury or with the lead forming soluble

compounds, which are readily eliminated from the system. In many cases of wakefulness from mental worry and fatigue, unrest of the peripheral nerves, over-brainwork, etc., the bromine waters have proved of great benefit. Asthma and chronic bronchitis also improve under the waters.

The bromine waters act as alteratives, and stimulants to the lymphatic system, promoting absorption and the elimination of morbific material; hence they are of special value in scrufulous tumors and ulcerations, syphilitic swellings and nodes, and chronic cutaneous diseases.

7. Calcareous or Earthy Mineral Waters.

The solid ingredients of these waters predominate with calcium, carbonate and sulphate, producing the "temporary" and "permanently" hard water.

Therapeutically, the waters are not much used. They may prove useful in rickets and softening of the bones when the lime salts are deficient.

8. Carbonated Mineral Springs.

This class of mineral waters is rich in carbonates and bicarbonates of many of the mineral compounds, such as soda, lime, potash, magnesia, etc., and has an excess of carbonic acid gas. The waters are all acid when first drawn, owing to the excess of the carbonic acid in the water. The carbonated waters resemble the alkaline waters in this, that they have carbonates and bicarbonates of the alkaline elements—alkalo carbonated, alkalo chalybeate and alkalo saline—with the addition of an excess of carbonic acid gas, making the waters alkalo acidulous, alkalo-chalybeate acidulous and alkalo-salino acidulous. Most cold mineral springs contain free carbonic anhydride; hence become carbonated waters, unless some other ingredients predominate.

THERAPEUTICS.

The carbonated waters are used much the same as the alkaline (*quo vide*), as we have simple alkaline waters; so have we also simple carbonated waters, such as seltzer, soda, apollinaris, etc. Most of the simple carbonated or soda waters are manufactured artificially and sold on an extensive scale as "soda" and "seltzer."

The natural carbonated-acidulous mineral waters are much to be preferred on account of the several ferruginous and alkaline ingredients they contain.

These waters are very grateful to the stomach of febrile patients, lessening nausea and gastric irritability, rendering the fluids in the body alkaline, and promoting a more copious secretion of the urinary organs.

The carbonated waters are pleasant vehicles in which to administer medicines, lemonades, etc., etc.

Frequently these waters are better borne by the stomach than anything else. The carbonated waters are antacid, tonic and diuretic, very useful in dyspepsia, to be taken before or after the meal, according to the form of the malady.

In biliary calculi the carbonated waters have been found very beneficial. An acid which dissolves feldspathic and micaceous rock must also have some action on urate of lime and biliary salts.

Vesical calculi are also influenced by these waters. As in catarrhal affections of the bladder, chronic cystitis, etc.

Carbonated waters are also extensively used in Europe for albumenurea (Bright's disease of the kidneys). The chalybeate carbonated waters would be even more beneficial than the simple alkalo-carbonated.

In the sick-room the waters may be taken in wineglassful doses *pro re nata.*

9. Chalybeate or Ferruginous Mineral Water.

These are waters impregnated with the salts of iron as well as with the other mineral constituents, in varying proportions. The (*a*) simple-acidulous-chalybeate waters are the carbonated waters with iron. The (*b*) salino-acidulous chalybeate are the alkalo-salino-carbonated impregnated with ferruginous salts as well.

Therapeutics.

Chalybeate mineral waters are of great benefit in the treatment of anæmia—a condition of the blood in which there is a paucity of red blood corpuscles, hæmato-globulin in the blood. The ferruginous waters produce a constructive metamorphosis creating more red blood corpuscles, thereby increasing the specific gravity of the blood and of the bodily weight, reproducing a healthy glow and the rosy cheek on the faded and bleached out face.

It appears to be a well-established fact that one of the functions of the red blood corpuscles, besides taking up oxygen and eliminating carbonic anhydride is to convert oxygen into ozone, in which form the oxygen becomes so efficient in the system. After a course of iron water the bodily temperature rises, the cold feet and chilly nights are changed into warmth and comfort. The elimination of urea increases.

The ferruginous waters are recommended in debility consequent upon chronic discharges, anæmia, chlorosis, fluor-albus, scrofula, rickets, passive hemorrhages, dyspepsia, when depending on deficient energy of the digestive function, neuralgia, chronic malarial fevers, all of which destroy the health giving properties in the blood—the red globules—as well as the functions of the reproductive organs ; in all these wasting diseases the chalybeate waters are of undoubted value. Pure air, pleasant and healthy surroundings and plain, wholesome food, are important adjuncts in the restoration of the vital powers.

The iron waters are best taken after meals after a lapse of from a half to one hour, in wineglassful to tumblerful doses. The stomach, gastric and intestinal juices are then in the best condition for absorption. Taken for passive hemorrhages, the hemorrhagic diathesis, ammenorrhœa, hysteria and the many pelvic disorders frequently depending on anæmia, and in the paludal cachexia, leucocythemic exophthalmic goitre, etc., the waters may be taken every three hours in wineglassful doses.

The ferruginous waters, more or less charged with the salines, are recommended in the treatment of hepatic engorgement, hæmorrhoidal affections, chronic diarrhœa, strumous diseases, albuminurea (Bright's disease), etc. To reap the fullest benefit of a course at the chalybeate springs, it is necessary to pursue the treatment faithfully, and under the guidance of competent medical advice. Under such conditions the author does not hesitate to say that these ferruginous waters are invaluable in the treatment of the many diseases above named.

10. Chlorinated or Muriated Mineral Waters.

This class of springs contains chlorides of sodium (common salt), potassium, lime, etc., and conveniently may be divided into: *a.* Simple chlorinated. *b.* Chlorino-lithiated. *c.* Brines.

The (*a*) simple chlorinated springs are such as we find at the foot of the Salt Mountains.

The (*b*) chlorino-lithiated contain in addition some salt of lithium, and the (*c*)brines are the stronger chlorinated waters.

Therapeutics.

The chlorinated waters are strongly diuretic and antacid, useful in rheumatism, gout, scrofula and abdominal plethora. Chronic catarrh of the mucous membranes is also much benefited by these springs. As many of these salt springs are hot, bathing for rheumatics is found to be a beneficial mode of treatment.

(II). Iodine Mineral Springs

The existence of iodine, bromine and arsenical natural mineral waters has been doubted for a long time, but the author has now personal knowledge of their existence on this coast. (See analysis.)

As iodine, bromine and chlorine exist in the sea-water and submarine vegetable life, a fact demonstratable at any time, it is not at all wonderful that a country for ages submerged in the briny deep, and in which we find mountains of salt, should also have iodides and bromides from the submarine deposits. Well-known spas on the continent contain them, and so do many of our springs in California.

The principal salts of iodine found are: *a.* Iodo-bromine. *b.* Iodo-sodic. *c.* Iodo-potassic. *d.* Iodo-magnesic, etc.

THERAPEUTICS

The utility of iodine or any of its salts is most conspicuous in the treatment of constitutional states, such as enlargements of the lymphatic glands, glandular swellings, enlargements of any of the internal organs, spleen, from chronic malarial poisoning, goitre, scrofulous tumors, syphilitic enlargements, etc. Iodine salts and waters are also found to be of great benefit in chronic bronchitis, catarrhs, asthma, chronic pleurisy, rheumatism, gout, and chronic Bright's disease, scrofulous and syphilitic contaminations producing cutaneous or internal tumefaction or ulcerations are successfully treated by this class of waters. Aneurisms have also been benefited.

Springs containing iodides have usually salines enough to act gently on the gastro-intestinal tract, ferruginous salts to act on the blood, chlorides and carbonates to act as diuretics, besides the iodides to act specifically on the constitutional state, counteracting, as they do, many pathological (abnormal) conditions, strumous or glandular enlargements, and producing disintegration of the morbific proliferation, by causing its absorption, removal and elimination.

The iodine mineral waters are contra-indicated in stomachic irritation and acute inflammation. The waters may usually be taken freely one or two hours after meals.

(12) Magnesian Mineral Springs (Bitter Waters)

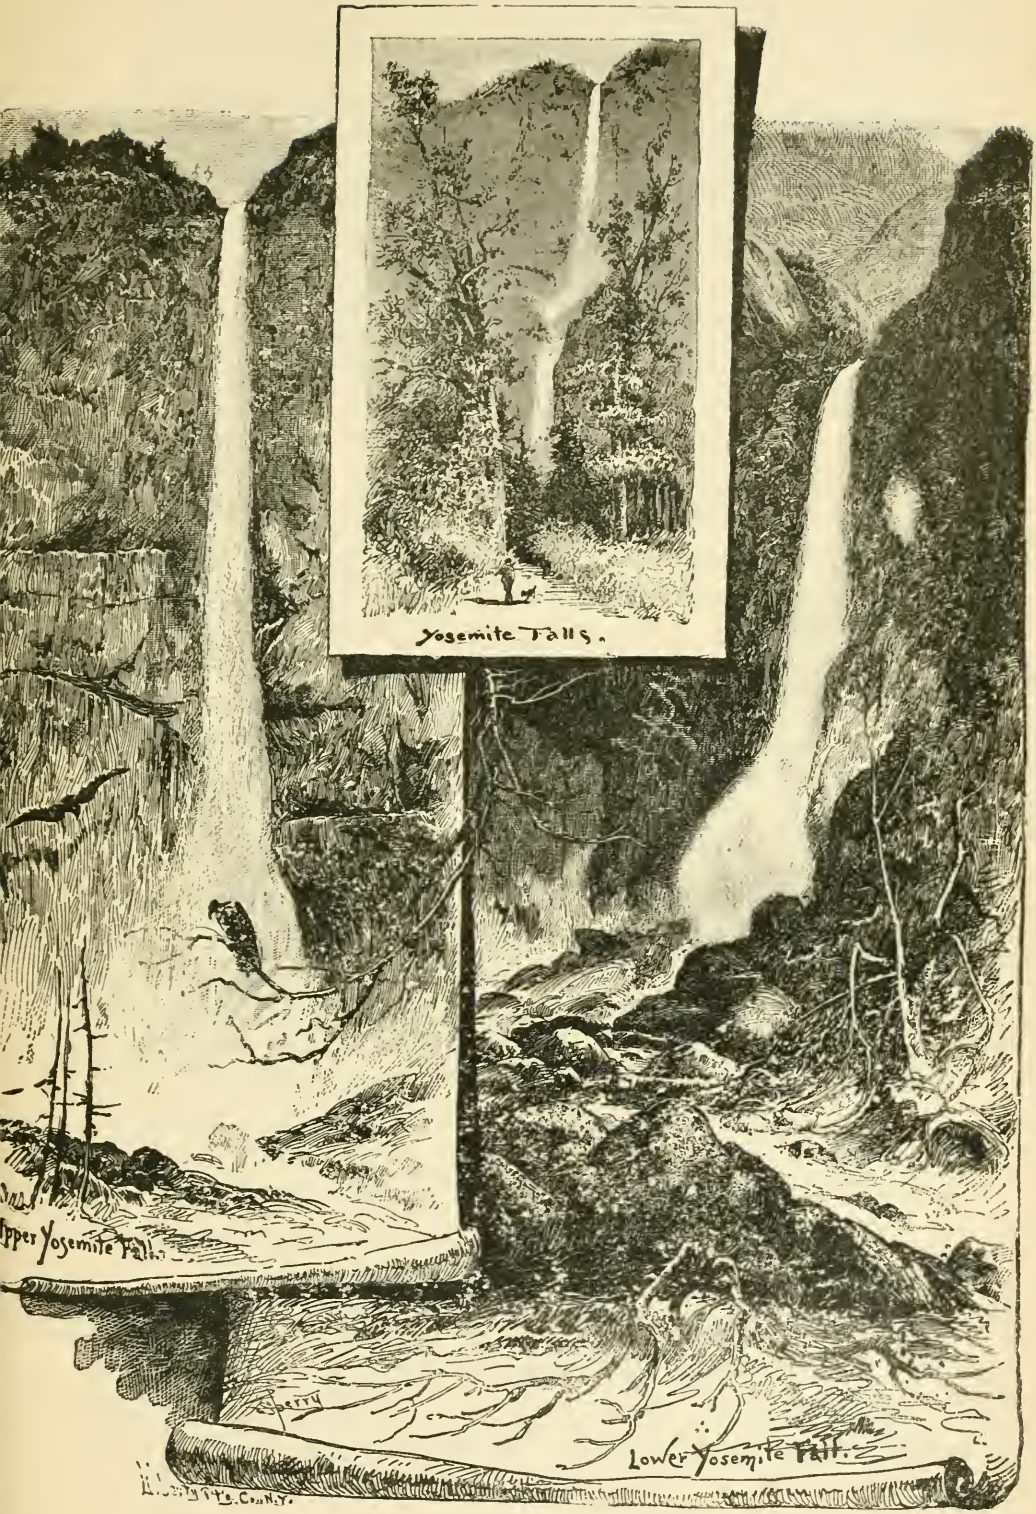
These springs contain Epsom salts (sulphate of magnesia) in varying proportions, and may be divided into: *a*. Laxative mineral waters. *b*. Purgative mineral waters. *c*. Saline mineral waters. *d*. Salino-alkaline waters. *e*. Salino-sulphureted waters.

The (*a*) laxative waters contain less and the (*b*) purgative more sulphates of magnesia and sodium. The (*c*) salines are more or less aperient according to the dose, and the (*d*) salino-alkaline contain alkaline chlorides and carbonates, while the (*e*) salino-sulphureted have also sulphur or sulphureted hydrogen besides the magnesia salts.

THERAPEUTICS

As a rule these magnesian waters are carbonated and pleasantly laxative and purgative according to the dose. They are well received by the stomach. The action is due to an increased intestinal secretion superinduced by the active endosmotic and exosmotic action of the magnesian and saline salts, hence the easy watery evacuations produced. This exosmotic or outward flow takes place chiefly from the blood-vessels and is not so much from the glandular appendages of the intestinal mucous membrane. The magnesian laxative, purgative and salines are of especial efficacy in acute inflammatory diseases. They are important remedies in the treatment of renal and cardiac anasarca (dropsy), and in acites from obstruction of the portal circulation.

There is probably not a better treatment for cachexia from saturnine poisoning or painters' palsy, etc., than these magnesian waters. Bitter-salz is also an important remedy in mercurial and copper poisoning, forming inert



Yosemite Falls.
Upper Yosemite Fall.
Lower Yosemite Fall.

and insoluble sulphates of mercury, lead or copper, and as such is eliminated from the economy.

For dysenteries, sick headaches, flatulence, colic, and acidity, magnesia waters are of great value. The engorgement of the liver, superinduced by congestion of the pelvic viscera, sub-involution, chronic metritis, etc., and in hæmorrhoidal difficulties these waters have proved highly beneficial. The best time to take aperient or laxative waters is about half an hour to an hour before breakfast a gobletful or two according to circumstances. For chronic constipation nothing is better. For obesity the waters may be taken several times during the day in large doses with marked loss of weight in a week or two.

The pendulous abdomen of middle life may be largely removed by a course of the magnesian waters. For chronic eczema and other skin diseases the salines are serviceable.

The saline-sulphureted waters will be noted under the head of "sulphureted waters."

13. Siliceous Mineral Waters

These waters contain alkaline silicates and salines. They are not used in medicine.

The springs are famous for their petrifying qualities. Many are so strong in silicates that a piece of bark or wood may be petrified in a few days. The wood is not "turned, to stone," but each atom and molecule of the woody fibre is dissolved by the silicates, and silicon oxide molecules and atoms occupy the identical spots, reproducing the fine lines and traces so admirably that the kind of wood can easily be determined by the grain of the petrification.

14. Sulphureted (Sulphurous) Mineral Springs.

These waters are usually surcharged with sulphureted hydrogen, characterized by the ancient-egg smell familiar to all who have visited sulphurous regions. The springs

are usually hot or warm, and contain sulphates of many elements, sulphides and frequently sulphuric acid.

The *a*. sulphides are rare, the *b*. sulphates and *c*. salino-sulphur are quite common, while the sulphureted hydrogen is more frequent in sulphureus waters. There are also cold or white sulphur springs, which do not have much sulphureted hydrogen, but are frequently mixed with carbonates and carbonic acid gas.

THERAPEUTICS

The great reputation which sulphureted waters have acquired is the best proof of their efficacy as adjuncts to other treatment. Especially is this the case in rheumatism, gout and skin diseases. The waters being usually saline as well as sulphurous are valued in congestion of the liver, abdominal plethora, chronic malarial fever with enlarged spleen, etc., engorgements of the pelvic viscera, metritis and hæmorrhoidal diseases. Uterine tumors are said to have been improved by using these waters.

Syphilitic and strumous diseases are markedly benefited by the sulphur waters. Bright's disease also has been improved while using the mineral waters. Tuberculosis during its incipiency is benefited by the inhalation of the sulphureted hydrogen and by drinking a moderate amount of the water. Acute and chronic rheumatism and gouty arthritis, synovitis, white swelling, chronic joint injuries, and the many chronic cutaneous diseases, are certainly immeasurably benefited by a course at these springs, especially by the hot sulphurous water and mud bathing. (See baths.) The sulphureted waters are taken internally in six to eight ounce doses several times daily, according to the disease. It is best to take the water before breakfast and between meals. For chronic laryngeal, pharyngeal and nasal catarrhs the waters are used as a douche with much benefit. Likewise in the chronic uterine catarrhs and disorders the hot sulphurous mineral water

douche, using several gallons two or three times daily, has proved very successful in the author's experience.

Thermal Springs

Most thermal mineral waters are sulphurous, varying in temperature from 85° F. to 214° F. Thermal waters also contain salines, chlorides, carbonates, etc., etc. Occasionally thermal springs are not sulphurous, but calcic or alkaline.

THERAPEUTICS

The thermal waters are extensively used for bathing purposes, especially those that are sulphureted. For chronic cutaneous diseases, and cases requiring the absorption of chronic exudations in swellings of the joints, old gunshot wounds, chronic gout and articular affections, etc., etc., the treatment is very popular, and certainly aids materially judicious internal medication in alleviating and curing these obstinate and troublesome diseases.

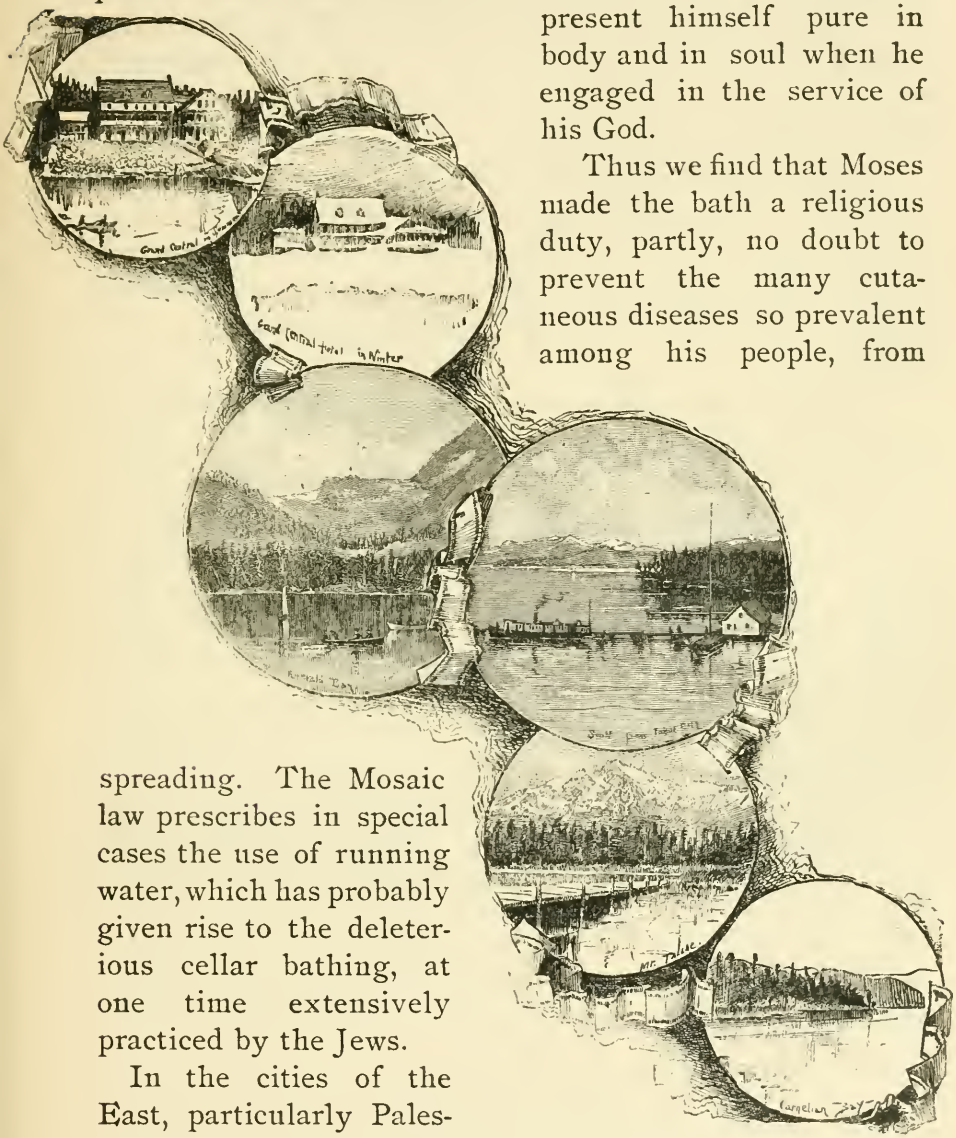
All over the State the thermal and mineral springs, of which there are about three hundred, are being rapidly developed. Extensive improvements are being pushed; elegant and commodious hotels and cottages are being built, with all the modern conveniences and luxuries; gardens and parks, with shady walks and commanding outlooks, are growing; and California, with her excellent climatic advantages, may confidently be expected to rank first in the Union, if not in the world, as a health resort and mineral water sanitarium.

The Bath

Bathing dates back to the earliest existence of the human race. It was practiced for the treatment of diseases as well as for the preservation of health, and for luxurious enjoyment. The most ancient historical accounts, and the primeval mythologies speak of the bath as being of divine origin.

The Egyptians practiced bathing as a religious rite; and throughout antiquity purification of the body was supposed to be conducive to moral purity. Man was taught to present himself pure in body and in soul when he engaged in the service of his God.

Thus we find that Moses made the bath a religious duty, partly, no doubt to prevent the many cutaneous diseases so prevalent among his people, from



spreading. The Mosaic law prescribes in special cases the use of running water, which has probably given rise to the deleterious cellar bathing, at one time extensively practiced by the Jews.

In the cities of the East, particularly Palestine, the wealthier people indulge in costly and extravagant bathing facilities and luxurious baths. Bathing conveniences were established in their houses and in their gardens,

where considerable time was spent each day in the enjoyment of the warm bath. The same arrangements still prevail in most of the civilized parts of the East.

Homer frequently speaks about bathing among the early Greeks. It was indispensable in the religious preparations for the sacrifice, for the reception of oracles, and for the holy sacrament of marriage.

Most ancient civilized nations observed the practice of bathing as a religious rite. Public and private bathing establishments existed in the larger cities throughout Greece, some being exclusively for men, some others for women, and others again were for men and women promiscuously.

Rome, at the zenith of her power, possessed some of the finest edifices for bathing that the world has ever seen. The accommodations were perfect, and are scarcely equaled by those of to-day. The baths were taken warm or hot. After one of these luxurious baths the Romans had their bodies anointed with perfumed oils; the bathers then indulged in gentle exercise, such as games, etc., and lastly the body was washed, rubbed, dried and perfumed with costly essence. The ancient Germans used medicated baths, but to a less extent than the Romans. In England bathing was first instituted by the Romans.

When Roman luxury was driven out by German thrift, those splendid bathing edifices, the finest the world has ever seen, fell into disuse and ruin, and were it not for Christianity, by its institution of baptism preserving the religious signification of the bath, the dark ages would possibly have wiped out its existence in the West for some considerable time.

The Arabians and Mohammedans adopted bathing early. Islam enjoined on the faithful corporal purity and prescribed daily ablutions. The rich erected costly baths, and in every city in which there was a mosque the public bath was also instituted.

Imitations of those costly oriental bathing establishments are found to-day in the structures in Constantinople and other European cities. The bathing process is described as follows—not a bad one, by the way, for many diseases of the present day :

The bather undresses in a warm, comfortable room, wraps a blanket around himself, puts on wooden slippers to protect his feet from the hot floor, and then enters the bath-room proper. Here are plunges of hot and cold water, douches of hot and cold water and hot steam. After spending a few minutes in the steaming-room the bather soon breaks into a general perspiration. This lasts from five to fifteen minutes. The next step is a plunge into the cold water or the use of the cold douche ; immediately after which the body is rubbed with woolen cloths and anointed with a salve which softens and whitens the skin. This is generally accompanied by "kneading" the body. The bath attendant stretches the bather on a table, pours warm water and salve over him and begins to press, squeeze and twist his whole body with wonderful dexterity. Every limb is straightened and stretched. The attendant kneels upon the bather, seizes him by the shoulders and makes his back crack till the vertebræ quivers. The bather is next treated to soft blows all over the fleshy parts of the body. After this he is rubbed with hair cloths. The hard and calloused skin on the feet is next rubbed with pumice-stone. The whole body is next rubbed with soft soap and the bather plunges into the hot water. Here he remains a few minutes and is taken out and thoroughly rubbed dry. The body is now anointed with perfumes, the hair and beard are trimmed and the bath proper is completed for one day. The bath lasts about two hours and makes one feel as if he were born anew. An inexpressibly delightful sensation of comfort pervades the entire body, and as the bather stretches himself in one of the cooler rooms the sense of luxurious contentment soon wafts him off into a sweet and refreshing sleep. At the end of an hour or two he is

awakened and partakes of coffee, sherbet or lemonade, and the bath is completed.

The healing of the sick by means of bathing in mineral and thermal springs became a recognized plan of treatment among the earliest fathers of medicine. The god of medicine, Æsculapius, was invoked and temples were erected to his honor.

Over the thermal baths of Antoninus was engraved on a large marble slab a Latin sentence imparting instruction and warning to the bathers and invalids that, if they wished to be relieved and cured of their diseases, they must first leave all cares behind them, otherwise the waters would be inoperative.

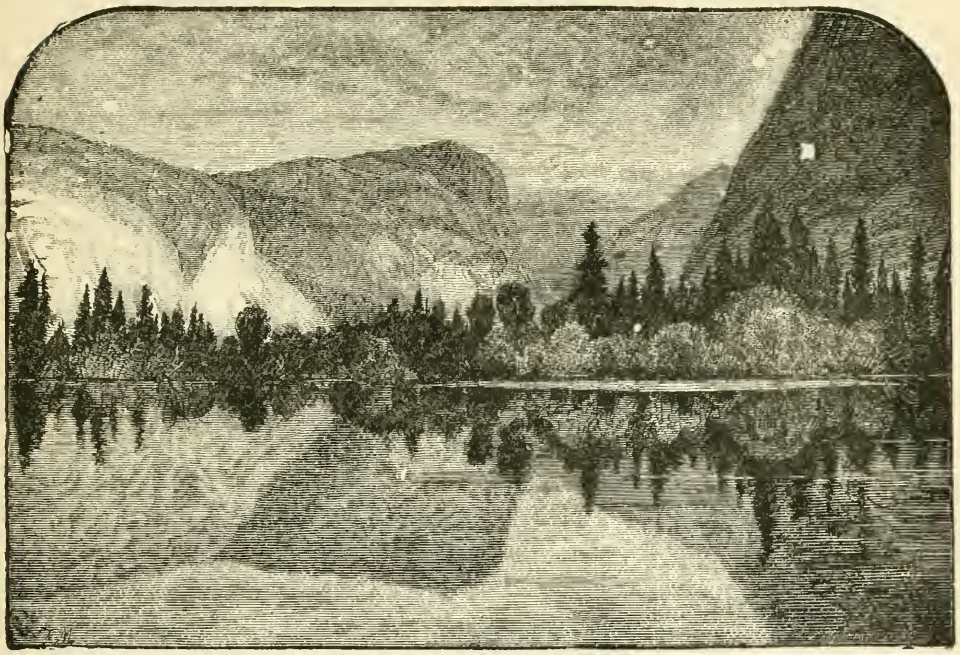
During the Crusades the Europeans first felt the great necessity for frequent ablutions in medicated baths. The wanderers brought home leprosy and other skin diseases, which spread rapidly by contact; hence bathing became universal, and the mineral springs were sought out and used extensively.

In Russia the hot steam and medicated and mineral baths are much used. The bathing facilities are not so extensive as they are farther south. Many of the poorer bathing establishments consist of a small apartment built of wood, with benches all around a central pit. In this pit water is thrown on red hot pebbles. Immediately dense hot fumes are produced, which envelope the bather, who lies undressed on one of the benches. The steam often rises to a temperature of 112° F. After sweating for some time cold water is dashed over the bather, who is then rubbed and anointed and dressed.

Frequently a bather will run from the heated steam chamber out into the snowbanks, in which he rolls for some minutes before he is rubbed and dressed.

Our American aborigines used the hot sulphur springs faithfully for nearly all their ills. They have been known to travel hundreds of miles to reach a special thermal spring. When, however, no mineral spring is within reach

they use an appliance very similar to that of the Russians. It consists of a hole in the ground, or a hut whose floor is covered with stones. These are made hot by burning logs of wood over them. When sufficiently heated water is thrown upon the fire and heated stones, and the patient is shut up in the hut or covered in the hole for a specific time, lasting from a few minutes to half an hour, and in some instances as long as three hours. This is the "sweat bath" so much in vogue by many tribes in California.



Classification of Baths.

The bath may be classified according to the medium in which a part or the whole body is immersed or surrounded, and according to the temperature, etc., employed. Thus we have the hand and foot bath, the eye bath, the sitz bath and the half or the whole bath. We may take a sea bath, a river bath, a slipper bath, a plunge, shower, dripping or douche bath. The temperature may be cold, tepid, warm or hot. The medium may be pure water, mineral

water, saline, sea or sulphurous water, or composed of sand, earth, mud or moor, or of animal excretions. (This latter is used to a considerable extent in California, and sometimes is mixed with mineral waters for bathing purposes.) In Mexico, Central America and among the Indians of California this method of applying animal egesta in the form of poultices to sores and inflamed limbs, etc., is much in vogue.

Then we have vapor baths, cold, warm or hot. These may be simple or medicated, natural or artificial. Compressed air baths have also been instituted. The animal and vegetable baths are not used to any extent at present. The vegetable medicated baths, in which the body is soaked, may be composed of wine, vinegar, solutions of essential oils, infusions of thyme, rosemary, lavender, wormwood, willow, oak or Peruvian bark, etc., etc.

Animal medicated baths are made up of milk, blood, bouillon, oils or fat.

Then there is the medicated vapor bath, in which aromatics, incense, myrrh, benzoin, amber, sulphur, calomel, etc., may be used for a part or the whole of the body. These baths are usually administered in vapor boxes, in which the body is incased and the head is free.

Suitable rooms are also arranged for vapor baths, where the patient walks about naked for a specific time each day. Compressed air chambers and medicated heated air chambers for pulmonary diseases have also been introduced with some success.

The animal bath, much used by the ancients and highly extolled by them for many cutaneous and joint diseases, consisted in wrapping the whole or a part of the patient's body in the warm skin of a recently killed animal. In the case of lameness the patient's limb would be incased in freshly drawn blood. Frequently the smaller animals were killed, split open and applied directly to the affected part. In some instances a patient's limb would be introduced into the breast or abdomen of one of the larger

animals while it was yet alive. This practice is now all but obsolete.

The vegetable and animal medicated baths, in which the patient's body is surrounded by wine, milk or both, etc., for some considerable time, can be safely recommended in many cases of inanition, or where the stomach or digestive apparatus is out of order and starvation is imminent. The skin will absorb enough to keep the patient alive for a considerable time.

The Temperature in Bathing

The cold bath has a temperature of 40° to 60° F.; the tepid bath is from 60° to 95° F., and the warm bath from 95° to 100°, and the hot bath from 106° to 110° to 140° F.

Bathing is recognized to-day as a very important agent in the preservation and restoration of health. Besides promoting the healthy and regular exudation and secretion of the sudoriferous and cutaneous glands, bathing assists very materially in absorbing and removing pathological products, particularly in the skin or in and around the joints.

The virtues of water bathing, especially those of the natural mineral waters, have long been established and are daily receiving a more extended application.

Since the modern developments of Balneotherapeutics a new school or class of people have styled themselves "hydropaths," "water-curers," etc., and, with the exaggeration which is incident to everything new, the promoters have promised a panacea for "all the ills to which the flesh is heir," which, of course, is as absurd as it is ill-founded. Now that these quackish pretensions are all but universally ignored or buried in oblivion, it is generally admitted by scientific and medical experimenters that mineral waters are capable of a large range of effects. Taken internally the action, of course, depends upon the mineral ingredients. Used externally in the bath the action depends upon the temperature at which it is employed, as well as upon its chemical composition, the duration of bathing, the reaction which follows, etc.

The Skin

An average-sized individual has from 200 to 240 square inches of cutaneous surface—sixteen to twenty square feet—containing from 2,300,000 to 7,000,000 pores or orifices, through which the normal healthy secretion and excretion of the sudoriferous ducts, sudoriferous and cutaneous glands, pass. The skin also exhales gases besides the solids and liquids. If these 7,000,000 little outlets, each one of which measures one millimeter or more in length (about half a line or one-twenty-fifth of an inch), were joined together in as straight line or tube we should have a canal or pipe over twenty-eight miles long!

Many experimenters have carefully weighed the transpiration passing through the skin. The most notable experimenter—Sanctorious—carried on for thirty years a most careful analysis. He daily weighed all his food and drink and the natural excretions from his person. By careful computation extending over more than a quarter of a century he determined that more than one-half of all foods and drinks were eliminated by means of the skin and pulmonary exhalations. The skin carries on one-fortieth to one-fiftieth of the entire respiratory act; that is to say, through the cutaneous surface we exhale carbonic acid gas and inhale oxygen.

The skin throws off many poisonous substances from the body, such as urea, uric acid, lactic acid, biliary acids, poisons from malaria, cutaneous diseases, and blood diseases and water, fatty matters and epidermic debris. The activity of this eliminative process is hastened and kept in perfect order by the use of mineral baths, thus ridding the system of these morbific agencies. This supplementary action of the organs of the skin may be seen in the "yellow jaundice." Here the normal secretion of the biliary pigments and the natural flow of bile are interfered with through disease. Almost immediately the skin attempts to throw off the bile and pigments. The perspiration will be found to be tinged yellowish, and react to bile acids.

In many diseases the skin is made to act as an adjunct to the organ or organs affected. Thus, in kidney disease, the skin and lungs are made to eliminate the effete materials which should pass through the diseased organ. In lung troubles, the skin and kidneys work off what the lungs normally do, and so on. Indeed the skin can be made to do more. We can keep a person alive for a considerable time by frequent bathing in milk, broths and soups, etc., the whole nourishment passing through the cutaneous openings. Medicaments may be applied to the skin and be completely absorbed. The skin can even be made to inhale oxygen and exhale the poisonous waste product, carbonic acid gas, from the system. Hence we see that the function of the skin is far more important than we imagined, in the preservation and maintenance of health and in restoring the body in disease. As a rule too little attention is given to the subject of bathing and cutaneous medication in America. We have no time, "business, energy and push" absorbs us wholly.

From the foregoing it will be seen that should these 3,000,000 to 7,000,000 little pores be stopped up by decayed scales from the skin—epidermis, by oil, grease, or any waste product from the body, or by dust or dirt from without the body all or a part of this normal exudation or transpiration of solids, liquids and gases must of necessity be repressed and retained in the system to the detriment of health and strength. If half of all our ingesta were naturally eliminated from the cutaneous surface and lungs, the suppression of any of the outlets must throw an extra amount of labor on the remaining pores, or the effete materials must find their way out of the body by some other channel or produce immediately serious results. Fortunately the economy is so admirably constructed that if one organ gets out of order another steps in and takes its place – at least for a time. But this doing double duty, working without sleep or rest cannot be endured for any length of time. In this way, from any partial suppression

of cutaneous exhalation and excretion the lungs, and more especially the kidneys, are obliged to dispose of any work the skin is incapacitated from doing, thereby throwing an extra amount of strain on these organs, which it is impossible for them to endure long without showing signs of overwork. This frequently ends in kidney (Bright's) disease, and the long train of symptoms with which only too many have had personal experience. It is a *sine qua non*, that if the skin does not act, the organs of egestion must dispose of the morbific material, and most of the work, as before remarked, falls to the kidneys, producing irritation, inflammation and the many diseases which follow.

The author does not doubt that many cases of Bright's disease in California can be traced to an impaired function of the skin, because the hygroscopic state of the atmosphere prevents the rapid evaporation of perspired fluids and interferes with a perfect function of the cutaneous surface. (This at least is the case on the sea-coast.) Hence we see the necessity of keeping the skin in prime condition. Any impervious coating applied to the entire cutaneous surface of a person would produce death in a short time, as we know from the instance of the child who was once gilded to take a part in a great Roman festival.

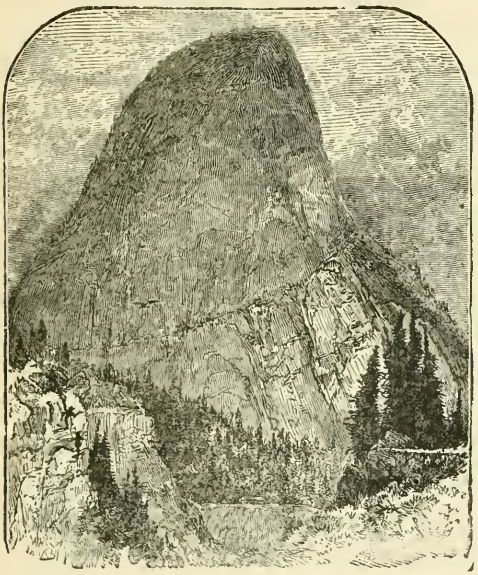
Natural Mineral Water Baths.

The external application of several of our mineral waters is more efficacious in the treatment of many diseases than the internal administration. This is particularly noticeable in the rheumatic, gouty, strumous joint affections and in several varieties of skin diseases.

The most beneficial bath in the world may, however, do great harm if injudiciously used. Indeed, fatal effects have been repeatedly observed. It is, therefore, urged that a careful diagnosis be made of the case and that medical surveillance be kept up constantly during a course of bathing, and that self-treatment and indiscriminate bathing be

discountenanced. Not only will the spring waters do more good if intelligently used, but the many fatal results occurring every year will be prevented.

To follow medical advice in the matter of bathing and using mineral waters becomes all the more necessary and important, when it is borne in mind that each thermal and mineral spring differs materially in composition and temperature from any that may have been used before. Hence it follows that when one water may be used in more than one way, to derive any benefit, or the greatest benefit, from it, it must be applied discriminately. Place yourself, therefore, under the management of the competent keepers of the baths and the attendant physician, and do not use your own judgment about a matter which you but imperfectly understand.



CAP OF LIBERTY

With these precautions there can be no doubt about the beneficial results accruing from a systematic course of mineral water or mud bathing, instituted as an auxiliary measure, in the treatment of these chronic diseases. The beneficial results obtainable by the warm (95° to 100° F.) and hot (100° to 140° F.) mineral water and mud bathing are perfectly logical and susceptible of actual demonstration.

The sensations experienced on entering a warm mineral bath are exceedingly pleasant. A feeling of comfort and enjoyment steals over one immediately following immersion. This continues during the bath, imparting to

the system generally a genial sensation productive of luxurious contentment. If in pain the patient is much relieved, and if moderately well he feels at ease with the world and only wishes this paradise of enjoyment and physical well-doing could endure forever.

The warmth with which the body is surrounded is communicated to its surface and rapidly permeates the entire system, internal as well as external, until it reaches the central nervous system, from which reaction supervenes.

The first noticeable phenomena after the pleasurable sensations are a slight redness, and considerable swelling and expansion of the integument. These effects are produced by the dilatation of the smaller blood-vessels under the relaxant influence of the heat. As the bath continues this relaxant action is not confined to the skin alone, but is also felt in the structures which lie beneath it, as well as in the organs within the body. The fascia, muscles, tendons, and particularly the products of inflammation and tumefaction in and around the joints, seem to soften and exhibit less tension. This influence of softening and expansion of the cutaneous surface observed after immersion in the warm bath is not an apparent but a real swelling and distension, as may be demonstrated by the wearing apparel, such as the finger rings, etc , becoming too small. Now this increased circumference of a foot, hand or finger, and the enlargement of the cutaneous surface generally, is not altogether due to the dilation of the blood-vessels and relaxant action of the warmth and moisture, but to the fact that part of the mineral waters, gases and mineral ingredients have actually been absorbed into the integumentary system and circulation throughout the body, through the millions of little pores and absorbent orifices, and even through the skin by the well-known law of osmosis. This absorption is further found to be in direct ratio to the specific gravity of the bathing medium. The blood has a specific gravity of 1,050 to 1,070, pure water being 1,000. An ordinary warm, fresh water bath has a specific gravity of 1,005 to 1,010. Applying

the law of endosmosis and exosmosis, the bath abstracts vitality instead of imparting vigor. This we know is actually a fact. A hot bath always leaves one weaker. Now the mineral saline and sulphureted, and the mud waters used for bathing at many of our spring resorts, have specific gravities of from 1,100 to 1,250, therefore it will be seen that the greater specific gravity medium may pass through the animal membrane—the skin—into the blood, which has a less specific gravity. This actually occurs. The mineral constituents—crystalline—readily penetrate the integument and enter the circulation, as may be demonstrated by a chemical examination of the blood and urine before and after bathing. Not only have the salts of minerals—sodium, potassium, iodine, sulphur, etc.—been tested and verified, but the gases in the bath themselves have been observed in minute traces in the blood.

It was not until recently that this question of the power of the skin to absorb water, mineral ingredients and gases assumed anything like definite proportions, as authorities and experimenters were at variance. The mooted point may, however, be regarded as satisfactorily settled now by the many carefully conducted observations of Maden and Collard de Martigne, confirmed by the excellent experiments of Barthold, Williams and Edwards, who unhesitatingly affirm that salines and mineral ingredients are absorbed into the system and may as such exert their specific influence and be tested chemically in the blood and secretions.

The Effects of Mineral-Water Bathing on the Circulation and Respiration

The temperature of the bath determines the relative force and frequency of the heart's action.

Both pulsation and respiration are increased in frequency on first entering the bath. If the heat be moderate, however, say from 95° to 100° F., the normal pulsation is

restored as soon as the body and the organs are thoroughly warmed. After that the only observable phenomenon is a greater fullness of the pulse, due in part to the absorption of the bathing fluid into the circulation and a relaxation of the arterial tension.

With every additional degree of heat beyond 98.5 ° F. (blood heat) to which the bath is raised, the rapidity of the pulse *pari passu* is increased. The bodily temperature also rises. This cardiac exhilaration often continues for a considerable time after the bath. It may run so high at the time of bathing as to be extremely dangerous where there is any heart disease at all, and may require prompt attention.

The pulmonary and the cutaneous transpiration are also increased by the warm and the hot bath, rapid disintegration of tissue ensues. The same is accomplished by prolonged bathing at a temperature of 105° F. The waste products of the body or of disease escape through the skin and pulmonary mucous membrane. Prolonged bathing of a high temperature in a water of low specific gravity can be advantageously and safely employed among the obese.

With the general dilation of the capillaries and the concomitant relaxation of the integumentary, nervous, muscular and articular systems, and with the osmotic absorption of some of the salts and bathing fluids into the general circulation, there certainly seems to be a greater volume to the pulsations after a generous bath; capillaries, small veins and arteries, and the absorbents apparently sluggish in the performance of their duties from the tumefaction or inflamed condition of the surrounding tissues about a joint, take up renewed activity under the relaxant influence of the warm bath, and this is probably one of the explanations of the *modus operandi* by which a swollen joint or an arthritic affection improves so considerably under the use of thermal baths. The blood-vessels and absorbents dilate, their capacity thereby allowing freer movement of the circulation. The inflammatory products, usually partially organized tissue, also seem to soften and become absorbed.

Certain it is that these warm baths relieve the engorged condition of blood-vessels and inflamed tumefied joints, equalizing the circulation, as it were, and causing the swelling and stiffness to disappear gradually, especially when these means are combined with proper internal treatment. This can readily be demonstrated.

The nervous system is also benefited. We are all familiar with the soothing result of the delightful warm bath. The hot bath (110° F.) is stimulating and exciting to the nervous system, but a bath at 98° to 100° F. produces a sedative effect, allays irritability and alleviates the pain in over-sensitive nerves. This is exemplified by the soothing effect of a poultice in local pains or the immersion of a hand or a foot in warm water when it is painful or inflamed. After a tedious railroad journey or a prolonged mental strain nothing so allays the nervous irritability and calms the over-sensitive nerves as a warm bath. This sedative action is probably due to the general equalization of the arterial circulation removing local congestions or internal inflammations. Try a warm mineral bath after a tiresome journey and see how it refreshes you.

How to Bathe.

The palliative or curative effects of mineral-water bathing depend largely upon the composition of the water, the temperature of the bath, duration of bathing, and the diseases for which the treatment is taken.

Mineral baths are tonic, sedative, diaphoratic, derivative and alterative, according to their composition and mode of administration.

Rules for Bathing.

Time of day.—It is almost impossible to lay down a hard and fast rule of universal application relative to the hour of bathing for invalids, as there may be many subjective and objective circumstances which demand considsiderable latitude.

The best time for the usual warm 95° to 100°F. mineral

spring bath is about two or three hours after breakfast and one or two hours before luncheon, about 10 or 11 A. M. for those who dine early, and about the same number of hours after luncheon for those who dine late. In any event the preceding meal must be digested prior to the bath and the system must be beginning to feel the effects of the conversion of the food-fuel into force and vital energy. The system is then placed in the most advantageous condition for deriving benefit from the bath, which is then both agreeable and safe.

Caution.—Never take a warm, hot or cold bath immediately preceding nor directly succeeding a meal. The reason is obvious. During the process of digestion a relatively larger proportion of blood is invited to the digestive organs to assist in the chymification and chylification and absorption of the blood in order that the process may be more efficiently performed. Any unusual stimulation, such as would be superinduced by the application of warm or hot water to the entire cutaneous surface of the body, would be sure to abstract a large quantity of blood from the organs of digestion to the integumentary capillaries, and, in the case of bathing after meals, produce sudden interruption of the digestive process, checking the proper secretion of the digestive fluids, retarding assimilation and not infrequently producing congestive headaches, pre-cordial oppression, fainting and possibly cramps in the stomach and intestines from the undigested food. In the case of bathing just before dinner the same results are induced, with the exception that the internal anæmia and the cutaneous engorgement are produced before food is taken, instead of afterward, which militates against digestion fully as much, for besides not having much appetite immediately after the bath the food that is introduced into the stomach finds no juices to digest it and remains for hours in an undigested condition, thus laying the foundation for dyspepsia and all the evil effects of retained, undigestive food.

Bathing before breakfast, especially in cold (40° to

60° F.) water, is not recommended for invalids. Early morning ablutions can only be advantageously employed by one who is robust and vigorous in constitution, who has reactive power enough to render the bath beneficial or at least not injurious.

The author knew of a case—a gentleman of fine physique, who used to go down to the San Francisco bay every morning about six o'clock, winter and summer, and take a cold plunge and a swim. It did him good, or at least it did him no harm, for he was well and full of vitality. One day a sickly friend of his remarked how well he looked. "Yes," said the bather, "that is the result of my plunge in the bay every morning before breakfast. Why don't you come down to-morrow morning and try it?" "I believe I will," was the reply. The next day, a bright January morning, the two friends plunged into the bay. Alas! it was his last plunge, poor fellow, for the sickly friend did not have vitality enough to establish a reaction, although he walked home, a distance of about one mile. In the afternoon he was taken with a congestive chill, and in three days he died.

In perfect health it is considered highly beneficial to take a cold plunge, a slipper or a sponge bath before the morning meal, inducing complete and thorough reaction by rubbing, exercise, etc. It certainly seems to prevent a susceptible patient from taking cold as readily as without them, but one ought to be guarded about establishing the reaction.

Occasionally circumstances might render it expedient, or the personal habits and conveniences of the patient might require a warm mineral bath at night. Let it always be taken sufficiently long after dinner to insure more or less complete digestion. After the bath take care of the night air, for it is never as pleasant nor as safe for bathing as the morning atmosphere between the hours of ten and twelve o'clock.

The hot salino or alkalino-sulphureted waters, which are

principally used for bathing, open the pores of the skin, dissolve and cut away the oils and debris from the little outlets and induce more or less perspiration; hence, while the liability to catching cold is not nearly so great as when using plain water, it is nevertheless wise to guard against such a possibility.

TEMPERATURE OF BATHING

The cold bath is from 40° to 60° F.
The tepid bath is from 60° to 95° F.
The warm bath is from 95° to 100° F.
And the hot bath ranges from 100° to 110°, 120° and 140° F.

Steam baths range in temperature from 96° to 140° F. The temperature of every mineral bath should be ascertained by a thermometer *in the bathtub* all the time.

The remarks on temperature will apply principally to warm and hot mineral water bathing, as cold or tepid baths are seldom used by, or recommended to, invalids seeking relief at mineral springs.

Individual idiosyncracies require consideration in the matter of warm bathing. A temperature soothing and onic to one person might prove too exciting and too stimulating for another having a highly sensitive and nervous organization.

As a general rule, a bath at 96° to 98° F. is found to produce an agreeable, soothing and tonic effect. It is the temperature most generally recommended for entering the water. Should it be desired to produce severe diaphoresis or a strong tonic effect the bath may be entered at 100° F. to 105° or 110° F., but the conditions requiring such a bath are not often met with. Enter the bath at blood heat 98.5°F., and then gradually increase it to any desired temperature for the specific purpose of the bath. This will be found the most agreeable, as well as the safest and best plan. It will add much to the comfort of the patient and not a little to the

efficacy of the treatment if the dressing-rooms be sufficiently warmed to be agreeable, say from 75° F. to 80° F. This is quite important in the after-treatment (*quod vide*), and decidedly pleasant before the bath.

Whatever degree of temperature is desired it should be reached gradually, if above 100° F., and then steadily maintained throughout the duration of the bath, having a thermometer in each bathtub or plunge.

Caution: Persons of weak constitutions and invalids reduced by disease, as well as delicate and convalescent patients, should on no account venture into the warm or hot mineral bath without medical advice.

Hot baths should never be used by patients suffering with organic disease of the heart, nor by those who are subject to hemorrhages of the lungs. A plethoric condition of the body, with a tendency to cerebral congestion, indicated by vertigo, or swimming in the head, also contra-indicates hot bathing. Consumptives, especially the more advanced cases, do not receive much benefit from mineral waters, and the baths may, and often do, hasten the unhappy end if persistently used.

DURATION OF THE BATH

The time during which complete immersion is observed requires considerable attention. The mineral bath is a potent agent for good or for evil, and not by any means devoid of danger, if the temperature and the duration are not carefully watched and considered. The bather must be governed by the requirements and peculiarities of his individual case. For this purpose medical advice should be sought from time to time.

As a rule, the bath at a temperature of 98° to 100° F. for ten minutes acts as a stimulant and a tonic to the general system, and especially to the cutaneous surface.

Immersion from 15 to 30 minutes in the same temperature (98° to 100° F.) produces a decidedly relaxant effect,

opening the twenty-eight miles of tubing and the 7,000,000 pores of the skin, dilating the capillaries, softening the muscles and tendons and inflammatory products surrounding a swollen joint, assisting in the excretion of the effete materials, and allowing the absorption of many of the saline and mineral ingredients found in the mineral waters. This is the bath for joint affections—keeping the temperature at the desired point by allowing more hot water to flow in when necessary.

The patient must be watched. If faintness or giddiness, or præcordial or pulmonary oppression occurs, the bath must be instantly discontinued and reaction brought on as rapidly as possible. (See treatment after bathing). Should it be deemed advisable or necessary to continue the bath for a longer period in order to produce more pronounced effects, then greater care must also be exercised; when a prolonged bath is used, such as may be beneficial in many cases of cutaneous diseases and in scrofulous and syphilitic contaminations, then the temperature ought not to be above 100° F. Bloodheat 98.5° F. will always be agreeable and just as beneficial. In prolonged bathing always watch the heart's action.

One cause of faintness and præcordial oppression and labored breathing is the amount of water on *top* of the chest. It is not necessary to fill the bathtub so as to have six or twelve inches of water on your body. One or two inches above you is all that is necessary, and the weight is much less.

The lower the temperature the longer must be the immersion to produce the same results, and vice versa.

For a soothing and tonic effect, a bath lasting from five to fifteen minutes at a temperature of about 100° F. will prove most beneficial. For complete relaxation and profuse perspiration, this may be extended to thirty minutes.

In the case of a decided tonic and stimulant action, the hot bath may be used at a temperature of 106°-10°F., for a period of two to five minutes.

For the slow and continuous effect (used principally for skin diseases), a bath of 98°-99° F. for one, two or three hours, will be most serviceable.

Treatment After the Bath

It is important to establish complete reaction after bathing, be the temperature cold, warm or hot. The dressing-rooms and sweating-rooms should be comfortably warmed. Much additional comfort and benefit will accrue from having towels thoroughly warmed before using them for drying the patient. These are small matters, but of considerable importance in preventing bathers from becoming suddenly chilled by coming in contact with cold air and cold towels.

Immediately after leaving the bath the cutaneous surface should be briskly rubbed and thoroughly dried with rough Turkish towels. Should reaction be feeble the flesh-rubber, or flesh-brush, or flesh-strap may be advantageously used to stimulate the integumentary circulation.

In cases of retarded reaction, recourse may also be had to hot beef-tea or soup containing cayenne pepper, hot coffee, etc. In extreme cases Hoffman's anodyne (Spiritus Aetheris Compositus U. S. P.) fifteen to thirty drops in a hot whisky or brandy punch may be of great value. Let the bather observe the recumbent position, keeping him warm and continuing the rubbing process, and if the bath has not been indiscreetly used, reaction will soon follow.

In many cases it may be desirable to promote profuse perspiration. Such patients are briskly rubbed and dried, and then wrapped in warmed woolen blankets and placed in a comfortable cot or couch in a warm room for an hour or two. After which the body is again thoroughly rubbed and dried and the patient is then dressed. It is also recommended in certain cases to use the cold douche after a hot bath. Weakly patients, or those suffering with acute inflammation in the joints or in the skin should not resort

to its use unless advised by the attendant physician, as the shock may be too great.

After a warm or hot bath great care must be exercised to prevent the possibility of taking cold. Take a gentle walk or exercise slowly in the open air, providing the season permits. If this can not be done, then quietly remain in your own apartments for an hour or two after each bath.

It has been observed that in mineral water and saline water bathing much more tonic and stimulating effects are produced if reaction be thoroughly established than after bathing in ordinary water. Mineral baths are much more strengthening and more derivative to the surface and the entire system and can be taken consecutively for a much longer period than with the use of ordinary water. The liability to take cold is also much less. It is an excellent plan to gently rub a stiff or sore joint with some stimulating and anodyne lotion after each hot bath. This seems to assist in the absorption of the inflammatory proliferation around the joint.

Frequency of Bathing.

The frequency of bathing must necessarily depend upon the disease for which the patient is being treated, the condition of the individual's strength, the duration of each bath, the reaction that follows and the temperature employed.

At first the most benefit will probably accrue from the use of one or two baths per week. Then take a bath every other day, and, if necessary, one every day. It is a matter of great importance, and as each case is an individual one the best advice can only be given by your physician.

Caution.—Do not commence a course of treatment at the springs by bathing once or twice daily. The American fashion, as noted elsewhere, of hastening and rushing through everything may do well enough for business, but where the life of an individual or the treatment of an obstinate disease is at issue this plan is not only deleterious, but may prove fatal to the life of the patient.

BRIDAL VAIL FALLS

"Upreared within the azure sky,
Like temples leaf-crowned, vast and high
They firmly stand;
No breeze can sway their massive strength,
Or shake their mighty breadth and length,
By tempests fanned;
Their first of life what man shall know,
That sprung two thousand years ago?

"Two thousand years! two thousand years!
Of human sufferings, joys and tears,
In ceaseless chase;
When these great structures had their birth
Our Saviour had not walked the earth
To save our race;
Yet then, amid their boughs on high,
Time's diapasons swept them by."

Minor Ablutions.

Occasionally, in the treatment of young children, delicate women and persons of feeble constitutions, it may be deemed unadvisable to immerse the whole body in any kind of water. For such as these we can recommend the partial bath.

The writer has repeatedly treated subacute and chronic rheumatic affections with marked benefit by the partial bath, immersing only the affected member, hand or foot, in the hot water or mud bath. At the springs the hands, elbows, knees and hips may be similarly treated, with good results.

In most partial ablutions the duration of the time may be longer, the water hotter, and the bath taken more frequently if thought advisable.

HOT SITZ BATH

The sitz bath is of great value in many pelvic disorders peculiar to females. The sitz bath may also prove serviceable in rheumatic and joint troubles in the hips and gluteal region when a general bath cannot be taken.

THE DOUCHE

This is a powerful agent and must be used with due consideration. It consists of a jet of water, usually cold, which is discharged with considerable force against the body for a few seconds to a few minutes' duration. If the patient be strong enough to stand it, the cold douche taken after a hot bath produces a marked stimulating effect, providing complete reaction is brought about.

A capital use can be made of the douche by employing hot mineral water and allowing it to strike a swollen joint such as the knee. Considerable force may be employed and the douche applied one or more times daily.

The douche, be it hot or cold, ought never to strike the head or the abdomen.

THE SENTINEL

THE UTERINE DOUCHE

Several of the mineral waters used very hot (110-120° F.) by means of the douche have been found efficacious in the treatment of female disorders and uterine troubles, such as leucorrhœa, congestion, inflammation, menstrual irregularities, etc., etc. For this purpose the patient observes a horizontal position and allows a gentle stream of hot mineral water to be directed into the vaginal cavity. The uterine douche may be applied twice daily for from five to ten minutes in duration, using several gallons of the hot sulphurous or

mineral water at each operation. This has proved a most valuable and admirable plan in these chronic disorders, and is well worth trying.

THE SPINAL BATH

This consists in having a jet of cold, warm or hot water gently strike up and down the spinal column—a douche, in other words, applied to the spine. A pail or pitcher may be used for pouring the water on the spine instead of the pipe, although the latter, being continuous, is much more efficacious.

The spinal bath is recommended in the nervous disorders of females, especially that form of nervo-hysterical troubles frequently observed in the young ladies who are fond of late evening parties, theatres, balls, etc., and who spend most of the following day in bed or in the house reading exciting novels.

The bath can be advantageously used from three to five minutes every morning, according to the conditions of the patient. It should be followed by brisk rubbing and exercise in the open air.

The shallow or slipper bath, dripping bath, sheet bath, or wet pack, etc., etc., are not used at mineral springs, and will not be dilated upon in this place.

THE MUD OR MOOR BATH

These mud baths have been in use on this coast for many years. The aborigines used them long before the pale-faced stranger arrived. Wonderful and miraculous cures are handed down in the traditions of the red men. Crude huts were erected over these mud springs, and many an Indian has traveled hundreds of miles to bathe in a certain spring.

These ancient Indian moor baths have been extensively utilized at several of the mineral springs in California. Modern bathing facilities have been constructed, and mud

bathing has been reduced to a practical and scientific basis. A mud bath can be borne at a much higher temperature than one of water, on account of its low conducting power of heat. This aids in the absorption of the saline and mineral constituents and volatile gases and acids. The baths are stimulating to the skin, promoting secretion and excretion, and are much extolled in the treatment of obstinate joint affections of rheumatic, gouty, syphilitic or strumous origin. In chronic hypertrophy of the liver and the spleen, inflammation of the pelvic organs, kidney and bladder troubles, and in old, indolent skin diseases the writer has witnessed decided improvements. The temperature may be taken from 100° to 120° F., with the same precautions and observations noted under the head of water bathing. For a partial bath for hand, foot or knee the mud promises every advantage. For chronic rheumatism there is no better treatment instituted anywhere than these hot sulphurous and saline mud baths, together with the proper internal treatment.

VAPOR AND GAS BATHS

In many localities on this coast hot vapors and gases arise from the earth in conjunction with the mineral springs. The fumes are principally sulphurous, with a certain amount of steam from the water.

Suitable apartments are arranged for bathing purposes. The rooms are so arranged that the heated steam and sulphurous fumes can be regulated to any desired temperature. A hot and a cold plunge bath also adjoin it. The temperature of the vapor may range from 100° F. to 140° F., and the duration of a bath from a few seconds to several minutes. Care should be taken that no sulphurous (SO_2) or sulphuric (SO_3) anhydride is present in the inhaled vapors, as these gases are poisonous. It is also necessary to watch the heart's action and the respiratory process lest the gases be too oppressive and produce serious results.

After a sweating vapor bath the plunge may be prescribed, after which the usual rubbing to establish reaction should be resorted to. If prolonged diaphoresis be desirable, wrap up the patient in a warm blanket and place him in the sweating-room for one or two hours.

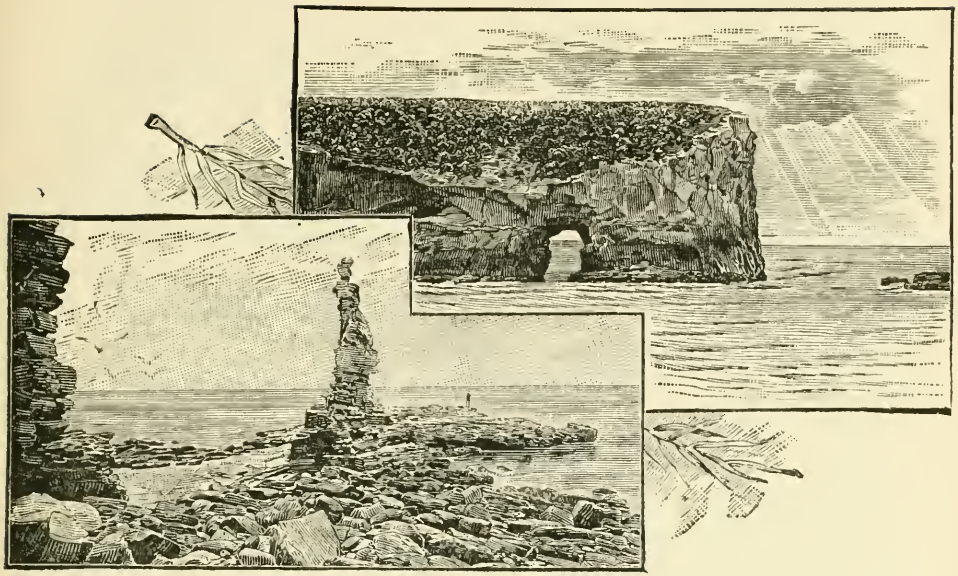
These natural vapor baths are very useful in catarrhal affections of the nose, pharynx, larynx and bronchial tubes. Chronic bronchitis and incipient phthisis improve by inhaling dry sulphurous vapors and mineral water steam. For inaction of the integument in chronic skin diseases the vapors have also proven beneficial.

Partial vapor baths may also be taken; and a limb, hand or foot can be encased in the hot steam.

The mineral water and mud baths, and, indeed, the mineral springs themselves, are not held out as "cure-alls." The author merely desires to call attention to their utility and the proper method of their application. Thousands—yes, millions—are using mineral waters and bathing in mineral springs yearly with more or less benefit. Used intelligently, carefully and persistently as auxiliaries to the recognized internal treatment, there can be no doubt that natural mineral waters do assist in the alleviation of human suffering and in the cure of many of the obstinately chronic diseases which unfortunately attack our fellowmen.

NOTE.—In making analyses of mineral waters and presenting them to the profession and public generally, it has been deemed expedient to employ the universal method of computing the mineral ingredients by the *grains* to the gallon. The more exact and scientific system of using *grammes* to the litre or parts per hundred or thousand, although superior, is not as universally adopted, and hence more imperfectly understood. Most of the analytical tables of foreign and domestic springs have, therefore, been reduced to conform to the analyses made by the author according to the old system of *grains* in each *gallon* of water. It will also be observed that all the *salts* of the same element are placed together, invariably beginning with those of sodium and following with those of potassium, magnesium, calcium, etc. The object in view has been to facilitate ready reference, which is accomplished by this arrangement, and, as sodium chloride is nearly always present in mineral springs on this coast, it has been thought proper to begin each analytical table with the most universal mineral ingredient.

—*The Author.*



OCEAN SCULPTURE NEAR SANTA MONICA

"*Imprimis*, my darling, they drink
The waters so sparkling and clear ;
Though the flavor is none of the best,
And the odor exceedingly queer ;
But the fluid is mingled, you know,
With wholesome *medicinal things*,
So they drink, and they drink, and they drink,
And that's what they do at the springs.

* * * * *

"In short—as it goes in the world—
They eat, and they drink, and they sleep ;
They talk, and they walk, and they woo ;
They sigh, and they laugh, and they weep ;
They read, and they ride, and they dance,
(With other unspeakable things);
They pray, and they play, and they pay,
And that's what they do at the springs."

1. ADAMS SPRINGS

These picturesque springs are in Lake county, two miles from Cobb's Valley, eight miles south of Clear Lake, and five miles from Glenbrook. They may be reached by the train which goes by way of Oakland Pier, Vallejo and Calistoga. From the last point a stage is taken which carries one along a pleasant mountain road hedged in on either side by manzanita copses, scrub oaks, and towards the summit fragrant redwood trees.

The resort itself lies among rolling hills which are thickly shrouded in verdant loveliness a greater part of the year. Beyond these hills lie the larger mountains of the Coast Range, banked to the summits with their heavy growths of redwood and pine. Fogs are rare in Lake county, and the air is uniformly dry, pure and balmy; more like Nice in the south of France than one would suppose from the difference in latitude.

The springs lie at an elevation of 3,300 feet above the sea level. Commodious quarters have been prepared for guests, and every effort is made to make every one feel at home. Hunting and fishing are excellent. Deer is rather scarce, but quail and rabbit are plenty; and the Clear Lake fish bite rapidly.

The water is cool and sparkling, and belongs to the alkaline-carbonated class. It is highly recruitive to persons suffering from chronic dyspepsia and portal congestion. It is also used for rheumatism. In cases of chronic Bright's disease it is reported to have especial efficacy. Chronic metritis has also been benefited. Facilities for hot and cold bathing have been provided, and the springs have acquired a high reputation, and are much frequented by visitors and invalids.

2. ÆTNA SPRINGS

Ætna Springs are located at the upper end of Pope Valley, at an altitude of 1,000 feet, in Napa County, sixteen miles northeast from the town of St. Helena. They are of easy access by rail via Napa to St. Helena and then by stage or carriage over a well-graded road. The drive is pleasant and full of interest; winding around and over Mt. Howell, along the cañon with its picturesque tangle of shrubbery, over brooks and mountain streams until the springs are reached. They are pleasantly situated in the midst of wild mountain surroundings. The atmosphere is delightfully dry and bracing, making one feel as though our primitive forefathers manifested their common sense when they scorned shelter of confining dwellings and lived

out in the open air. The humidity is very low, consequently the heat of the middle of the day is not felt. The exhilarating, balmy breezes of the afternoon give way to pleasantly cool evenings and perfect nights, insuring refreshing rest and sleep. In climate and natural surroundings Ætna springs are admirably located for a health as well as for a pleasure resort. There are ample accommodations for guests at the hotel and several handsome cottages for private use. The grounds are particularly well adapted for camping parties. The mountains in the vicinity of the resort are well stocked with wild game and the streams afford good fishing.

The temperature of the two principal mineral springs used for drinking purposes is about 98° F. The waters are sparkling, invigorating and tonic and slightly aperient. There are also springs having a temperature of 106° F., which are largely used for bathing, ample facilities having been provided for that purpose. Several other springs whose waters have not been analyzed are similar in composition, with the addition of more iron. These are known as the "Iron-soda" springs and are much used for anæmic and wasting diseases, producing constructive metamorphosis.

Ætna soda springs are rapidly gaining in public favor, and from the large number of visitors who go there yearly it is certain that decidedly beneficial results accrue from the use of the waters. Especially is this the case in the renal affections so frequent on this coast. Beneficial results are reported in rheumatism and neuralgia; also in dyspepsia, torpidity of the bowels, hepatic and uterine engorgement.

There is considerable similarity between the noted Ems water of European fame and our California Ætna soda, as may be observed by the following analyses. The Ems analyst is Professor Fresenius of Wiesbaden and the Ætna analyst is J. A. Bauer of San Francisco, made several years ago. My own analysis was made in 1888:

ÆTNA SODA

Gases	Cubic Inches
Carbonic Acid Gas,	63.

This analysis, made ten years after the preceding one, shows some little change in the composition of the water, Therapeutically, the change is probably for the better.

There are several important mineral springs not yet named and but slightly developed, which will doubtless be as important remedial agents (and about which pleasure resorts will spring up when they are developed), as we find their improved sister springs to be.

PALM VALLEY

3. AGUAS CALIENTES

In the southern portion of the State are located a number of important mineral springs. Several of these in different parts have been known as "Agua Caliente." Those situated in the Coahuila or Cabezon Valley, some ten miles south of White River, on Warner's ranch, fifty miles from San Diego city, in San Diego County, having acquired considerable celebrity especially among the native population. They are believed to be infallible remedies in syphilis and in cutaneous affections. These springs are situated on the slope of one of the ridges at the most easterly part of Warner's ranch. They are thermal, varying in temperature from 58° F. to 142° F.

The water boils up from a granite ledge through a number of openings or cleavage-fissures. It flows copiously, giving a volume of about a two inch pipe under

two foot pressure. Bubbles of sulphureted hydrogen and steam issue forth with considerable force, producing the characteristic smell of sulphur and clouds of vapor. At one place a small geyser has developed, emitting steam and water with a hissing sound. Incrustations of crystallized sulphur are deposited on the surrounding rock. (Blake.)

The waters possess a sulphurous and a not unpleasant acid taste, and are much used for drinking and bathing purposes. Formerly several Indian families were in charge of the springs and gave visitors the best accommodations they had in their crude huts. Latterly, since the springs have become generally known, better accommodations and facilities have been provided.

These hot sulphurous waters are highly recommended by many persons who have been there and used the baths and taken the waters. The diseases treated most frequently are rheumatism, sub-acute and chronic, syphilitic contaminations and strumous diseases, cutaneous affections, and renal and hepatic engorgement.

4. AGUA CALIENTE

Another Agua Caliente of some repute is located some thirty miles from Caliente station, on the Southern Pacific Railroad line in Kern county.

These waters are also thermal and sulphureted. The temperature varies from 80° F. to 100° F.

There is a small resort at the springs.

I have not been able to obtain water for analysis.

5. AGUA DE VIDA SPRINGS.

The springs are on the Arroyo Mucho, among the foothills of Cedar Mountain, southeast of Livermore, and at an elevation of 1,700 feet. There are a number of mineral waters on the place, both carbonated and sulphureted. The lower drinking spring is of light carbonated water, which is clear, sparkling and extremely palatable. In action it is tonic, antacid, diuretic and aperient. The upper or larger spring is mildly sulphurous, saline and laxative. These mineral springs were used many years ago, not only by the early settlers, but by the natives who dwelt in the valley before them.

Extensive improvements are being made on the grounds, consisting of a magnificent hotel surrounded by commodious family cottages. The grounds, which are naturally picturesque, will be still further enhanced by the construction of broad driveways, rustic bridges, cool arbors, in fact everything that can add in any way to the luxurious comfort of the guests.

Being only three hours' ride from San Francisco by rail, and possessing in the highest degree delightful climatic advantages, this ought to become a favored resort for health as well as pleasure seekers.

We find a number of springs here, most of them being carbonated. The principal drinking spring is found on analysis to yield as follows:

AGUA DE VIDA SPRINGS

"LOWER SPRING"—LIGHT CARBONATED WATER

DR. WINSLOW ANDERSON, Analyist, 1888

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains
Sodium Chloride	4.02	Calcium Carbonate	13.75

Gases	Cubic Inches
Carbonic Acid Gas	19.25

This comes under the head of light carbonated water, gently aperient and diuretic, an excellent antacid in many cases of dyspepsia. In several cases of cystitis, congestion of kidneys, etc., etc., I have found it of great benefit. There are other springs said to contain iron, and still others are lightly sulphurous. These latter are used for anæmia, chronic malarial toxæmia, chlorosis and rheumatic troubles. Further analyses will be made in the near future.

Carbonic Acid Gas	Not determined

This spring is one of the light carbonated mineral waters, gently laxative and diuretic, and excellent in certain forms of dyspepsia, liver and kidney troubles, etc. The writer has used it in a number of cases of cystitis with marked success. The springs have only lately been developed. A good hotel is built, and several cottages are nearing completion for summer occupation. Bathing facilities are also being constructed. The route of travel is to Livermore on the Central Pacific Railroad, and thence by carriage a few miles to the springs.

Magnesium Sulphate	8.70	Organic Matter	traces

Total Solids, 53.93

Gases	Cubic inches
Sulphureted Hydrogen,	2.74
Carbonic Acid Gas	9.25

This mineral water is of service in dyspepsia, torpidity of the liver and bowels, rheumatism, glandular affections, renal troubles and skin diseases. It would also be an excellent bathing water.

6. ALABASTER CAVE SPRING

Located in El Dorado county.

7. ALAMEDA WARM SPRINGS

Near San Jose, in Alameda county. These are all alkaline and carbonated.

8. ALDER GLEN SPRING

Situated two and a half miles from Cloverdale, in Sonoma county, which is now being developed.

9. ALKALI SPRINGS

Several alkali springs are situated in the northern end of Mono county. There are no analyses and no improvements.

Alkali springs, eight miles northwest of Quincy. No analysis.

Alkali springs, one mile above the mouth of Spanish creek. No analysis has reached us.

11. ALKALINE LAKES

Several large sheets of alkaline waters, fed by springs, are found in Modoc county about fifteen miles southeast of Alturas. No analysis.

There is also a small alkaline lake in Lake county, near Clear Lake. Not analyzed.

12. ALLEN SPRINGS

These valuable mineral springs are situated in the Coast Range of mountains in Lake county. They lie in a cañon near the head of Cache creek, some forty miles

west of the town of Williams, and three miles east of Bartlett Springs. The altitude is 1,800 feet above tide water. The resort and springs are beautifully situated in the cañon recess, shaded by huge oaks and towering pines, and surrounded by evergreen hills. The climate is delightful and salubrious, the atmosphere bracing and invigorating, and the evening air cool and pleasant. Out-of-door living is charming for a large portion of each year. There is good hunting and fishing near by, quite a consideration for overworked brains and underworked bodies reared in the cities like hot-house plants.

There are three alkaline and two ferruginous springs on the place. All are cool and pleasantly aërated with carbonic anhydride. The "Soda" spring, cool and sparkling, makes a delicious drink, which may be improved by adding a little syrup. The waters are all gently aperient, and have gained considerable reputation in chronic hepatic and renal affections associated with dropsy. Dyspepsia, chronic constipation, chronic malarial disorders, etc., are reported alleviated and cured by using the waters. The resort has ample accommodations and sets a good table.

Hot and cold bathing conveniences have been erected. There is also a hot steam bath, the water being artificially heated for this purpose. The grounds afford good camping facilities.

The following qualitative analysis is reported by Prof. W. T. Wenzell:

ALLEN SPRINGS

Mineral Ingredients	Mineral Ingredients
Sodium Chloride	Magnesium Bicarbonate
Sodium Bicarbonate	Calcium Bicarbonate
Sodium Sulphate	Ferrous Phosphate
Potassium Chloride	Silica
Magnesium Chloride	

The water is strongly charged with carbonic acid gas. The salts of sodium and magnesium predominate, while the

relative amount of calcium salt is small; therefore, the medicinal value of these waters is superior.

On analysis I find the water to yield:

ALLEN SPRINGS

ALKALO-SALINE

DR. WINSLOW ANDERSON, Analyst, 1888

Temperature 58° F.

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains
Sodium Chloride	23.16	Magnesium Chloride	.63
Sodium Bicarbonate	4.25	Calcium Bicarbonate	20.14
Sodium Sulphate	.78	Calcium Phosphate	.55
Potassium Chloride	1.90	Ferrous Carbonate	.93
Magnesium Bicarbonate	27.40	Organic Matter	trace
Potassium Bicarbonate	.75		

Total Solids, 84.20

Gases	Cubic Inches
Carbonic Acid Gas	36.

Samples of other springs were also analyzed and found to differ in some important particulars, viz.: in containing larger amounts of iron and less of magnesia and soda, and being less strongly aërated, rendering these springs more tonic and strengthening, and the former more antacid, diuretic and laxative.

13. ALUM ROCK SPRINGS

These springs are located in a romantic cañon with an unromantic name—"Penitentiary Cañon"—on the western slope of the Coast Range, about seven miles northeast of San Josè, in Santa Clara County. The cañon is so named in consequence of the habit among the early Jesuits on this coast of assembling there to perform penance.

The drive to San José is one of unusual grandeur, especially during the last two miles of the road, presenting an ever varying scene of ruggedness and natural beauty. Much of the roadbed is hewn out of the solid rock on the mountain side. The cañon is densely wooded, and the almost perpendicular cliffs shade the carriage drive, making

it delightfully cool and pleasant even in the hottest part of the day. The nearness of these springs to San José, and the splendid accommodations offered at the hotel, with the many natural advantages in consequence of the glorious Garden City climate, to say nothing of the health-giving constituents of the mineral waters, make Alum Rock Springs a favorite resort for tourists, Summer visitors and invalids. The temperature in Summer is rarely above 90° F., and in Winter never too low for comfort. Trout and mountain quail abound, affording good sport for the rod and gun.

There are several springs in activity at Alum Rock. The principal "soda" or drinking water is found on quantitative analysis to contain:

ALUM ROCK SPRINGS

ALKALINE WATER

DR. WINSLOW ANDERSON, Analyst, 1888

Mineral Ingredients	U. S. Gal. contains Grains	Mineral Ingredients	U. S. Gal. contains Grains
Sodium Chloride	10.21	Calcium Carbonate	19.05
Sodium Carbonate	7.14	Manganese Carbonate	trace
Potassium Carbonate	.76	Ferrous Carbonate	trace
Magnesium Carbonate	8.92	Alumina	6.45
Magnesium Sulphate	7.16	Silica	2.52

Total Solids, 62.21

Free Carbonic Acid Gas, Excess

CHALYBEATE SPRINGS

ALUM ROCK SPRINGS—CHALYBEATE AND ALKALINE

PROF. HATCH, Analyst

Mineral Ingredients	U. S. Gal. contains Grains	Mineral Ingredients	U. S. Gal. contains Grains
Ferrous Oxide	.30	Potassa	.20
Alumina	.15	Chlorine	1.60
Manganese	.70	Sulphydric Acid	3.30
Soda	3.40		

Total Solids (anhydrous), 9.65

It is well to mention that in this analysis the salts and elements are reduced to an anhydrous state. The same analysis with the water of crystallization would probably weigh several times more.

There are also two sulphur springs at a temperature of 85° F. These are used for bathing purposes. Alum Rock Springs have gained considerable reputation in the treatment of anæmia, chlorosis, chronic malaria, nervous prostration and debility. They ought to be of especial value in the hæmorrhagic diathesis, menorrhagia, etc., on account of the iron, alum and acids the waters contain.

THROUGH LAKE COUNTY

A lake that seems a silver mirror, swung
Up near the clear blue sky,
Around whose loveliness the guardian hills
In circling beauty lie.

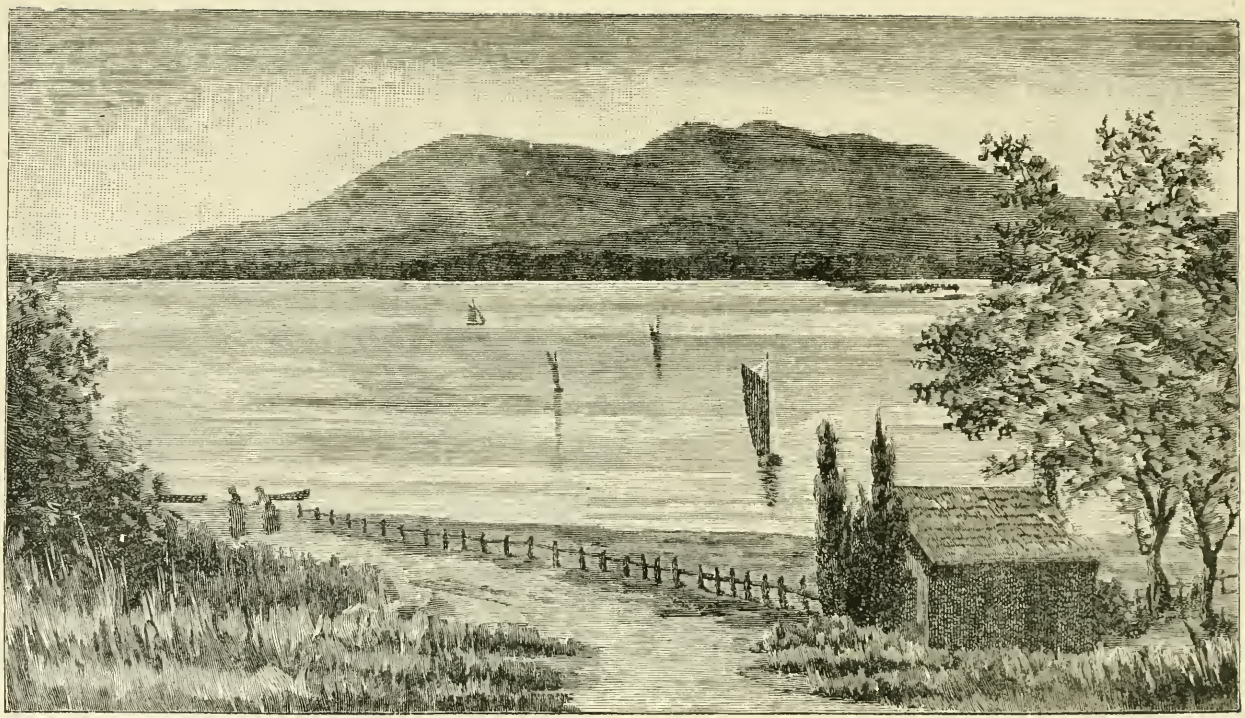
Mountains that hide within their silent breasts
Ashes of fires spent,
Whose torches lighted through the night of Time
Chaos' black firmament.

Cedars and pines that strike their piercing roots
In cold volcanoes' hearts,
That throbbed their lives out in some dead world grief
As human pain departs.

Valleys whose curves are like the carved designs
The hand of genius makes,
Inheritors of all the riches left
By long departed lakes.

Unnumbered springs and rills that from the Earth
Leap forth in melody
And take, down mountain side and valley sweep,
Their graceful, sinuous way.

This lake, that lonely watched through untold years
Orion his pathway trace
Now takes, in Beauty's western wonderland,
A proud and honored place.



CLEAR LAKE AND UNCLE SAM IN THE DISTANCE

Above the tombs of countless ages dead—
Nature's mute battle-fields—
Beauty and Strength have wrought their mysteries,
Order his scepter wields.

The burned-out passion of a dead world's pain
This granite dust of Time
Is re-incarnated in the lovely forms
Of flower, and tree, and vine.

The Spirit of the Past that wrought its work
And seemed to pass away,
Through loam and vine and grape is born again
The rich wine of to-day.

The old-world trees whose lavishness of leaf
Formed this rich valley soil,
Yielded their lives in travel, to the fruits
That now reward our toil.

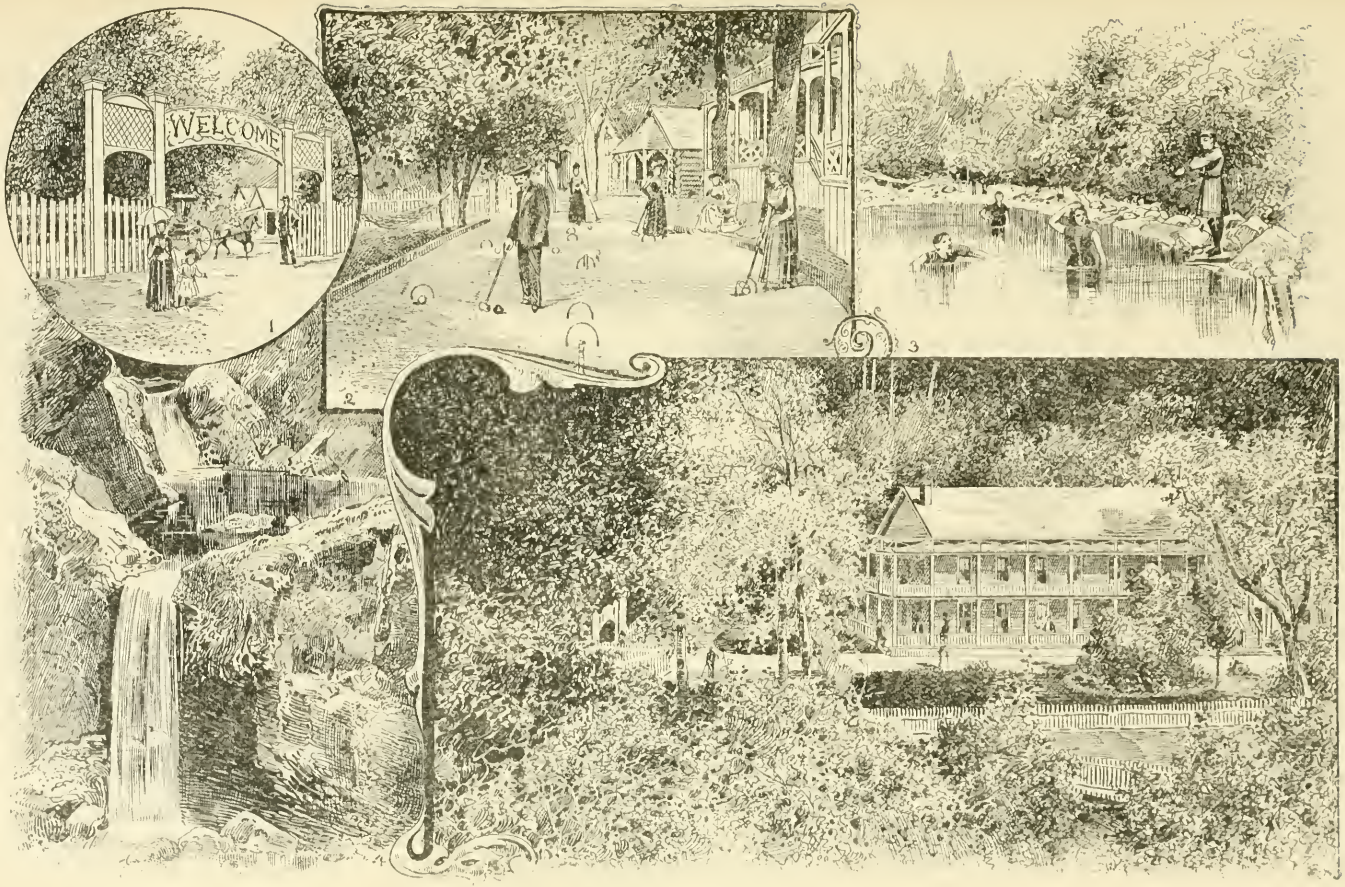
Thus ceaselessly the mystic whirl of Life
Makes its eternal round,
No link is lost, no hurry mars its sweep—
One perfect Whole is found.

—*Carrie Stevens Walter.*

ANDERSON MINERAL SPRINGS

These valuable mineral springs are situated in Lake County, nineteen miles from Calistoga, five miles from Middletown, and ten miles from the Great Geysers. They are of easy access by stage from the termini of the railroads, Calistoga and Cloverdale. The mountain roads are well kept, and the stage ride is one of the most picturesque in the State. The ever changing scene of hill and dale, forest and shrubbery, brooks with ferns and mosses, all combine to produce one of those pleasing scenes which one loves to mentally recall and review with realistic vividness.

The springs and health resort are themselves romantically located in a cozy nook in a small cañon, surrounded by forests and picturesque waterfalls.



ANDERSON SPRINGS

The climate is famous in Lake County; and in and around the springs, in the pine groves, the climate is unrivaled. The atmosphere is balmy and exhilarating, and free from humidity. One could live out-of-doors for six months in the year.

The worshiper at Nature's shrine, the lover of grand and varied scenery, will find all that can be desired at the Anderson Springs. The perennial mountain streams that softly murmur past the cottages, the bright water sliding over mossy banks and beds of pebbles, breaking into showers of sparkling diamonds; the caves, cascades and waterfalls; the cool, leafy dells; the cozy nooks and commanding outlooks; the conical shaped hills, covered with evergreen trees; the profound silence and solitude of the forest, where one can commune with one's inmost self, and where one might almost expect to surprise Pan and his pipes—all, in the glistening moonlight or brighter rays of old *Sol*—make a picture that only the pen of a Thoreau could describe or the pencil of a Bierstadt display.

Hunting and fishing are found in abundance all the year round.

During the season invalids and pleasure seekers come to Anderson Springs by the thousands and enjoy the invigorating mineral waters and the bracing mountain air.

The hotel and cottages afford ample accommodations, with every facility for comfort. The table is superior. For camping and outdoor life the grounds around the springs are well adapted. Miss Joey Anderson, the proprietress, is untiring in her efforts to please her guests and make them comfortable.

There are nine principal mineral springs. The main drinking spring is the "Cold Sulphur;" it is located about one hundred and fifty yards from the hotel. It is a saline and mildly sulphureted water, very useful in chronic skin diseases of strumous and syphilitic origin. In liver and bowel troubles, glandular congestion, uterine and ovarian

engorgement the water has been found of special value. It is aperient, diuretic and alterative in its action.

THE "SOUR" SPRING

This is one of the few mineral springs in California containing free sulphuric acid. Its sour taste was supposed to be due to alum, but from the following analysis, made for me by Mr. George E. Colby of the university, it will be seen that there is no alum present. The sour spring waters have proved very beneficial in hæmorrhages of lungs, menorrhagia, dyspepsia, etc. The water is tonic, astringent and gently laxative, pleasant to drink and of value in malarial poisoning and blood-glandular diseases.

The "Magnesia" or "Father Joseph" spring is an active laxative, rich in Epsom and Glauber's salt.

Another spring, known as the "Caro," is carbonated, and much used in kidney and bladder irritation.

Dr. Woolsey, of Oakland, has named one of these springs the "Cosmopolitan," because he considers it generally applicable for tourists and pleasure seekers.

It is a pleasant drinking water, gently laxative in its action, and of universal use.

One of the most valuable springs at the Anderson resort is the "hot sulphurous" or "bathing spring." These waters have a temperature of 145.5° F., and are very beneficial in rheumatism and chronic joint swellings, and skin diseases. Excellent facilities for bathing have been constructed, and the baths are extensively patronized. There is an abundance of hot sulphurous steam highly extolled in the treatment of weak lungs, chronic bronchitis and incipient phthisis, and catarrhal affections of the nose and throat. Many persons have experienced much relief from the inhalation of these vapors.

THE CATARRH SNUFF OR POWDER

On the rocks over the hot sulphurous and vapor springs are deposited incrustations of the vaporized minerals. This is carefully collected and powdered, and used as snuff in cases of chronic catarrhal troubles. The snuff has already gained quite a name, and is said to afford almost instant relief. Even in acute coryza or colds in the throat it produces an agreeable effect, and shortens the attack.

The following analysis is made from the dried powder:

ANDERSON SPRINGS—ANALYSIS "CATARRH POWDER"

Total, 100.00

Thousands of people are benefited at Anderson Springs every year. The waters, as will be seen from the foregoing complete analysis, are among the finest in the State, and the pine forests, elevation and climate are of unquestionable value in many sub-acute and chronic diseases. As a pleasure resort it is one of the loveliest spots on the coast.

ANTI-FAT SPRINGS

These springs are located in San Bernardino County, twelve miles from Temescal. The waters are alkalo-saline in character. A glassful taken three or four times daily relieves the portal and intestinal circulation, producing gentle purgation and thereby a lessening in bodily weight, hence the name.

There is a small resort at the springs. I have been unable to obtain water enough for a careful chemical analysis in time for this work.

14. ARROWHEAD HOT SPRINGS

These springs are located ten miles from Colton, in the San Bernardino Mountains, San Bernardino County. They are at an elevation of 1,600 feet above the sea. The Arrowhead Springs number twenty or more, and the combined volume of hot water issuing from the granite and limestone formation is very large. It has been likened to a good-sized millstream (Blake). The water is very hot, several springs having a temperature of 172° F. to 210° F.; others range from 166° F. to 108° F. The springs form one of the tributaries of the Santa Ana River. The springs are largely calcic or earthy, and contain:

Calcium Carbonate.
Magnesium Carbonate.
Alumina.
Ferrous Carbonate.
Silica.
Phosphoric Acid.

The Arrowhead Springs are so named from being at the foot of what is known as "Arrowhead" Mountain, which has a large spot on the side facing the springs that is comparatively free from brush and shaped just like an Indian's arrow. The length is 1,320 feet, and the breadth from shoulder to shoulder 350 feet. This space forms a conspicuous landmark for miles around. When the Mormons first settled there they used it for part of their religious ceremony, and it was known as the "Lord's mighty arrowhead" for the wicked.

These springs first came into general notice in 1858. Prior to that time the natives used to bring their sick and camp around the springs. They have gained favorable notice of late years in the treatment of cutaneous affections and rheumatism.

A large artificial pond has been erected for bathing purposes, the dimensions of which are 100 by 75 feet (Prof. McNutt). There are also a number of hot soft mud baths, which the Indians used extensively in former years and which had the reputation of being a certain cure for syphilis.

A large resort ought to be built at Arrowhead Mountain in the near future, as the springs are of undoubted value.

15. ARROYO GRANDE SPRINGS

These springs are located in San Luis Obispo County, fourteen miles north of the city. The waters are alkaline and carbonated and much used locally in bladder and urethral irritation and inflammation.

There is a small resort at the springs.

16. AZULE SPRINGS

These are located twelve miles west of San Jose, in Santa Clara County. The name is derived from the Spanish word *azule*, meaning blue. As the mountains in which

these valuable springs are situated have a bluish tint when viewed from a distance, so the springs came to be known as the blue springs in early days. The mineral water flows pure and sparkling from the subterranean chemical laboratory at an elevation of one thousand feet above the sea level. The grounds are owned by Hon. J. W. Ryland of San Jose, and while there is no resort on the place, the waters are bottled and shipped in large quantities to all parts of the State. The mean temperature of the air is 62° F. and the mean rainfall not excessive, being only 31 inches. The temperature of the spring water is 59.6° F. It is carbonated and pungent and is very similar to the famous seltzer of Nassau in Germany. Its action is antacid, aperient, diuretic and tonic, and it is of great value in dyspepsia, torpidity of the liver and the intestinal tract, increasing the process of secretion and excretion, and eliminating the morbific waste materials in the visceral and cutaneous systems. It is highly useful in habitual constipation, alcoholic dyspepsia, Bright's disease, uric and lithic acids in the urine, etc. On analysis one gallon of the water from the principal spring is found to contain:

17. BARTLETT SPRINGS

These famous springs are situated on the western slope of the mountain ranges near the head of Cache

Creek, in the northeastern portion of Lake County. They are reached via Oakland, Vallejo and Calistoga and thence by easy stage, or by Sacramento and Williams, or by way of Cloverdale.

LATEST ROUTE

"Formerly there were 35 miles of staging from the Sacramento Valley via Bites, and 55 to 60 miles via either Calistoga and Lower Lake, or Cloverdale and Lakeport. Now, the San Francisco passengers will stop at Hopland, and, after a stage-ride of 16¼ miles over an easy grade, will reach Lakeport to enjoy the steamer-ride of ten miles across the lake, while 14 miles more of staging brings them to Bartlett; so that passengers leaving San Francisco at 7:15 A. M. will get to Hopland about noon, Lakeport between 3 and 4 P. M., and Bartlett's in time for supper at 7 o'clock on the same day, and at an expense of about $2 less than by the old routes."

The distance is about 150 miles from San Francisco. The springs are located at an altitude of 2,325 feet above the sea. They are near the pine forests of the summits, in perfectly pure atmosphere. At this elevation the temperature is 10° F. cooler in Summer than in the valley 1,000 feet below. It averages 85° F. for Summer months. Humidity and fogs are seldom noticed.

THE DISCOVERY OF BARTLETT SPRINGS

Mr. Green Bartlett of Kentucky, having early suffered with rheumatism, came to this coast in 1856 in the hopes of being benefited by the climate. During one of his camping trips in Lake County Mr. Bartlett was taken ill with his rheumatism and happened to camp near the present springs. In the course of his disease he drank freely from the sparkling waters and rapidly convalesced. The springs were then taken up and a resort established. The springs are picturesquely located, with huge oaks and pines

to shade the now cultivated grounds. The hotel and cottages are excellently kept and offer facilities for about one thousand persons.

The main Bartlett spring is quite a curiosity. It is walled with artificial stone and surrounding it is laid pavement of the same material. A jar-shaped chamber about two feet in diameter and three feet in height is constructed directly over the spring, having outlets similar to those of a public fountain. It is estimated that the spring flows about 110 gallons per hour. One outlet flows in pipes to the bottling house and another leads into the hotel for the use of guests. There are also a number of other springs at the resort. One of these, some little distance away, is known as the "gas well." It is continually bubbling up with great force, resembling a boiling spring, yet the temperature was found in 1888 to be 54° F. This remarkable gas spring emits a large quantity of carbonic acid gas. It is asserted that if birds or animals remain at the spring for a few seconds they are sure to die from asphyxiation. The water is strongly carbonated and said by many persons who have tried it to be a sure cure for corns. South of the hotel are the "soda" spring, the "iron" spring and the "magnesia" spring. There are also several cold sulphur springs. The springs are all charged with carbonic anhydride and are pleasant, sparkling carbonated waters. Thousands of persons visit Bartlett every year and much benefit has accrued from the use of the waters in chronic malarial and rheumatic affections, chronic uterine diseases, etc. The waters are diuretic, laxative and alterative in their effects. Bathing facilities have also been added. The mineral and sulphurous waters are artificially heated for this purpose. The following analysis was made by Geo. E. Colby some years ago:

It is worthy of remark that in a number of instances I have found these superficial springs to change in composition in the course of years, or suddenly in the case of earthquakes. They are always changed by the surface waters and during rainy seasons, so that an analysis made in the spring of the year would necessarily be a little differed from one made in the fall, even though carefully performed under the same conditions and by the same analyst.

18. BEAR VALLEY HOT SPRINGS

In San Bernardino County, near Bear Lake and north of San Bernardino Peak, are situated a number of hot

springs. The waters are saline and calcic. The inhabitants in the vicinity use the water for kidney and bladder affections.

Water for analysis has not been obtainable.

19. BENTON HOT SPRINGS

Near Benton, in Mono County, is a very hot spring. It has a diameter of eighteen feet, and flows 2,700 cubic feet per hour. The temperature is 135° F. The waters are slightly alkaline, and much used for bathing purposes. It is claimed that an agreeable softness of the skin is obtained by its external use. The water is also used internally for rheumatism, gravel, etc. On evaporation it leaves very little residue, which is found to contain carbonates of sodium, magnesium and calcium.

20. BERKELEY SODA SPRINGS

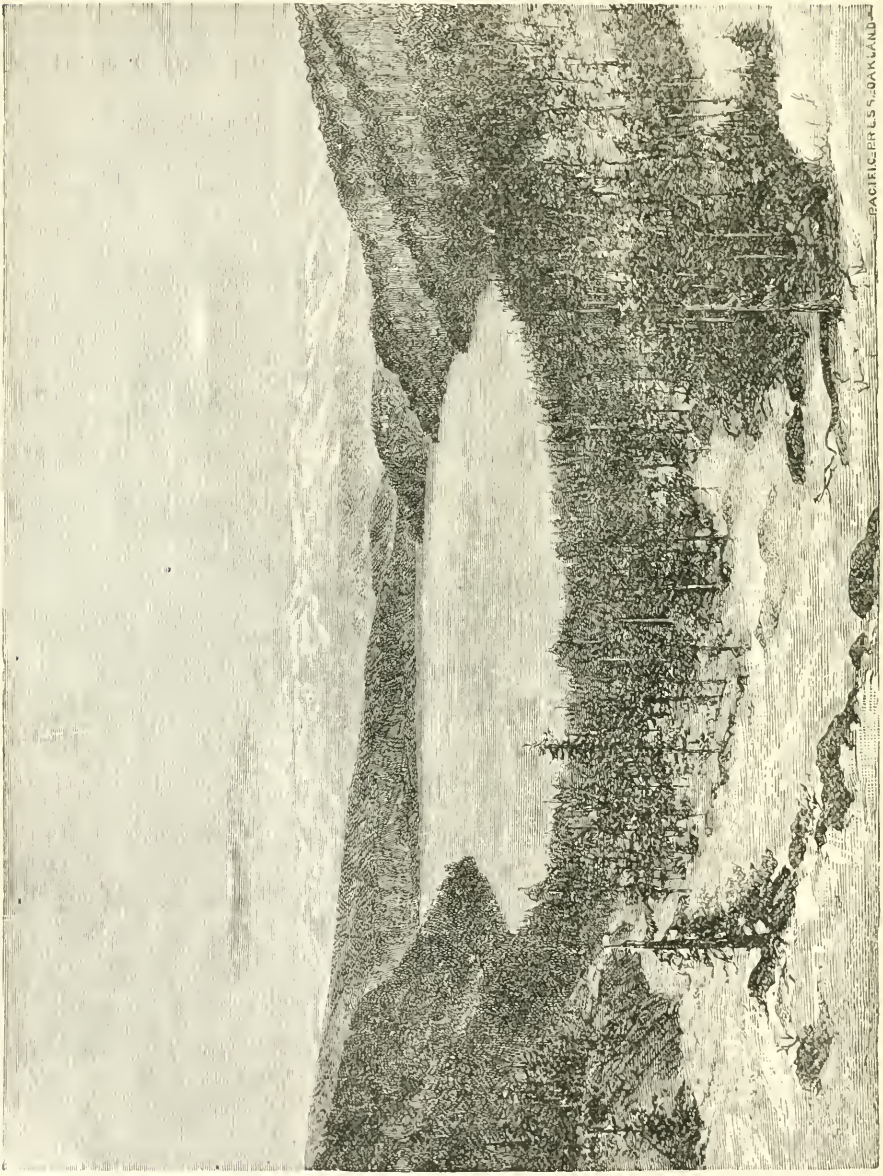
These excellent soda springs are located about ten miles south of Summit Station, on the C. P. R. R, in Placer County. They are the same as those we describe later on as the "Summit Soda Springs," by which name they are generally known.

21. BIG HOT SPRINGS

In Lassen County, some three miles north of Honey Lake, we find a large hot saline spring several feet in diameter. The water is constantly boiling up in a large stream, and forms one of the wonders of that section of the country. It has a temperature of 200° F., and flows 2,700 cubic inches per hour. There is no resort, and the water is not utilized.

22. BIG SULPHUR SPRING

In section 36, township 32 s. and range 21 east, Mount Diablo meridian, is located a large sulphur spring. It is not improved.



SIERRA SCENE

23. BITTER SPRING

This unique spring is situated in San Bernardino County, about eighteen miles north of Camp Cody. It is a cold saline spring. The water is not used commercially, nor is there any resort at the place. The water is rich in magnesium sulphate (Epsom salt), hence its name. It is much used locally for "bilious" attacks.

24. BLACK LAKE

This is quite a sheet of water, fed by several springs. It is located in Mono County, one mile west of Benton. The water is sulphurous and saline. Not used.

25. BLACK SULPHUR SPRINGS

A number of these black sulphurous iron springs are located in section 4, township 32 s., range 18 e. No resort.

26. BLANK'S HOT SULPHUR SPRINGS

These hot sulphur springs are located in Colusa County, and are the private property of Mrs. Lottie Blank. The waters are used locally for purposes of bathing and drinking, and have acquired considerable fame in the treatment of chronic skin diseases and rheumatic troubles, etc. There is only a local resort.

27. BLODGETT'S SPRING

These excellent mineral springs are picturesquely located in the Coast Range of mountains, about eight miles west of Gilroy. They are of easy access by the Southern Pacific Railway to Gilroy, and from there by daily stage to the springs.

The springs are under the personal supervision of Mr. Blodgett, who has erected a hotel and several comfortable cottages. The surroundings are beautiful. The atmosphere is pure, balmy and invigorating, and the mineral waters and mineral baths are of great therapeutic value.

One of the principal waters on the premises is the "Soda Spring." Its waters are found on analysis to be antacid, diuretic, aperient and tonic, and of great value in acid dyspepsia and catarrh of the stomach, constipation, kidney and bladder troubles.

The analysis shows that the spring is alkalo-carbonated and lightly sulphureted.

BLODGETT SPRINGS—"SODA SPRING"

ALKALO-CARBONATED AND SULPHURETED

DR. WINSLOW ANDERSON, Analyst, 1889

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains

Gases	Cubic Inches
Carbonic Acid Gas	9.25
Sulphureted Hydrogen	trace

The next most important spring is the "Sulphur." It also is antacid, laxative, tonic and diuretic, besides acting on the liver, kidneys and blood-glandular system. This water is good for rheumatism and sciatica, swelling of the joints and skin diseases. Excellent bathing facilities have been constructed, and Blodgett's Springs are rapidly gaining in reputation as a health and pleasure resort.

28. BOILING LAKES

In Plumas County, seven miles south of Lassen's Peak, are a number of hot bubbling and boiling springs. They are located quite close together, and several of them coalesce, forming lakes. The waters are alkaline. No resort.

29. BOILING SPRINGS

On the east side of Dry Salt Lake, and on the west side of Resting Mountain, in Inyo County, are several hot and boiling springs. The waters are reported alkaline.

30. BOILING SULPHUR SPRINGS

Several of these boiling sulphur springs are very picturesquely located on the south branch of Owen's River, northwest of Long Valley, in Mono County. They could be made valuable as a resort. The waters are alkalo-sulphureted and well calculated for the treatment of many diseases for which these sulphur waters are frequently used. There are no improvements.

31. BONANZA HOT AND COLD SPRINGS

These springs are located in a sequestered spot on the side of the mountain, among the pines and old oaks. It is one of the coolest and pleasantest places in Lake County during the heated summer season. The springs are two miles from Seigler's, six miles from Glenbrook and eight miles from Lower Lake. The elevation is about 2,500 feet. There are several pleasant carbonated waters on the place. One of these—the "Cold Soda," is a sparkling antacid water, containing diuretic and aperient properties. On qualitative analysis the Soda Spring is found to contain:

Sodium Carbonate,
Potassium Carbonate,
Magnesium Carbonate,
Magnesium Sulphate,
Calcium Carbonate,
Silica,
And Free Carbonic Acid Gas.

Another spring close by is found to be sulphureted and has a temperature of 84.2° F. This is used principally for bathing. It yields on analysis:

Sodium Sulphate,
Sodium Chloride,
Magnesium Sulphate,
Calcium Carbonate,
Calcium Sulphate,
Silica,
And Free Sulphureted Hydrogen Gas.

This is found beneficial in gouty and strumous joint affections.

The chalybeate spring has found a large use by the anæmic and pale-faced overworked city people who go to the resort. There is good gunning and fishing all the year round.

32. BORAX POND

This remarkable pond is situated about half a mile east of the lower end of Clear Lake in Lake County. The water is highly charged with biborate of soda (borax). During the dry season this water largely evaporates, and the borax, crystallizing out, is found around the margin of the pond.

Twenty-five to thirty years ago large quantities of this salt was manufactured here, supposedly the first made in the State, but latterly there has been no work done here, owing no doubt to the extensive borax discoveries in the southern portion of California.

33. BORAX FLAT

is situated in San Bernardino County, near the intersections of 117° 15′ and 35° 45′. They are all cold. Large crusts of borates are seen on the surface as the water evaporates during the Summer months.

Another borax spring is known as

34. BORAX MARSH

and is located some eight miles southeast of Hawley's Station in San Bernardino County. Then we have

35. BORAX PATCH

near Black's ranch on the S. P. R. R. line in San Bernardino County. The supply of borax seems inexhaustible, and all we need to make this a large industry is a little experimentation. I do not see why the sun's rays could not be utilized in the evaporating process.

36. BORAX SPRINGS

On the edge of Clear Lake, in Lake County, are several borax springs. The salt exists in considerable quantities as a biborate of soda. These waters are used locally.

During the last twenty years California has produced $5,000,000 worth of borax. (Report of State Mineralogist, Prof. Wm. Ireland, Jr., 1888.)

BORAX SPRINGS

There are extensive borax springs in the southern portion of the State—large shallow marshes, through which flow the mineral waters richly laden with borates.

37. BOYD'S HOT SPRINGS

By the side of Upper Alkaline Lake, in Modoc County, are located these springs. They are in Surprise Valley. The waters are alkaline and heavily charged with carbonic acid gas. Qualitatively the waters are found to contain:

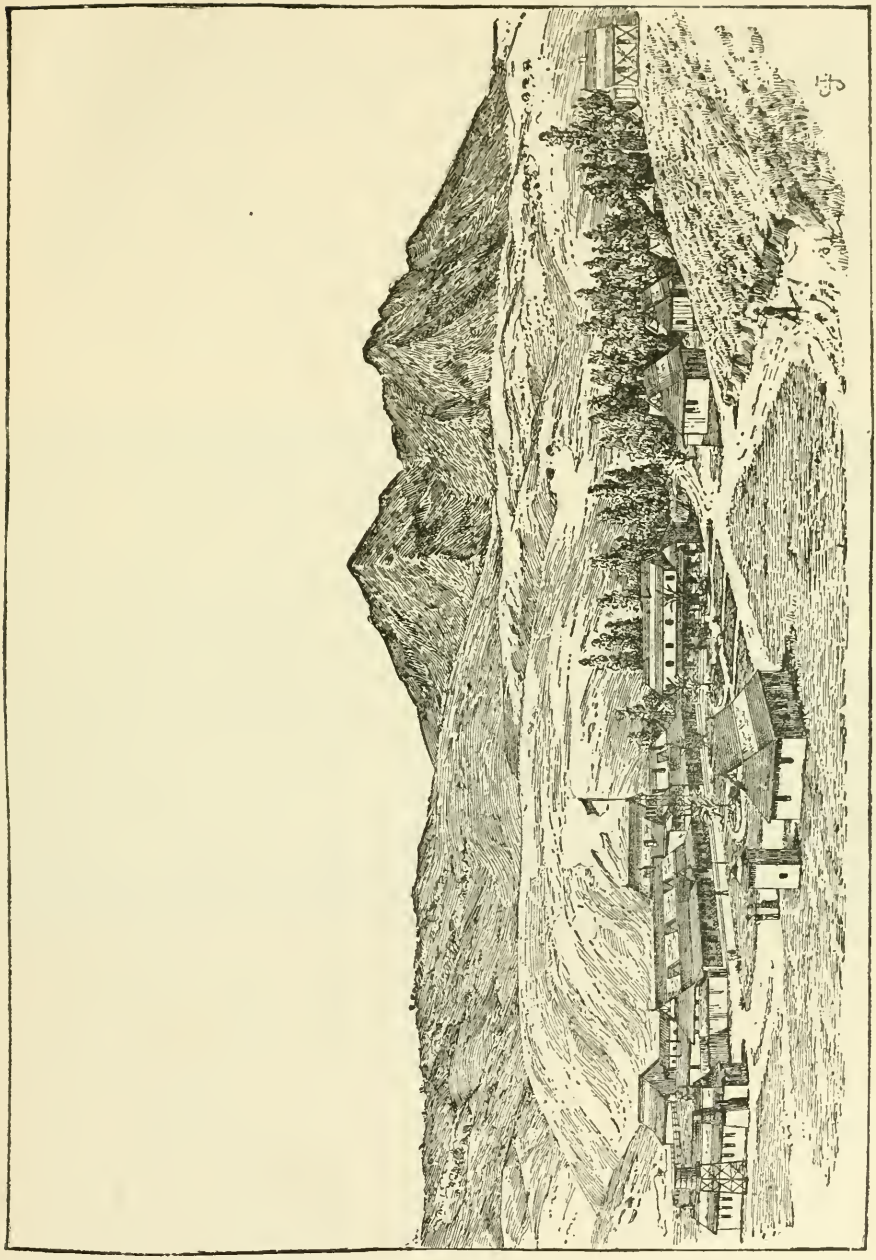
Bicarbonate of Soda and Potash.
Carbonates of Soda.
Lime and Magnesia.

A resort will probably be established at the springs in the near future.

38. BRANBECK'S BOILING SPRINGS

These springs are situated on the east side of Honey Lake, in Lassen County. There is one large boiling alkaline spring. No resort and no analysis. Water used locally.

"Soon did the portals of the east unclose,
Then all the waterfalls and mountain floods
Shouted with joy, and up the mountains rose
A solemn anthem from the bowing woods,
And morning's misty curtains rolled away;
The clouds in their superb apparel shone
As o'er the mountain tops the lord of day
Rose like a gorgeous monarch from his throne,
And shed refulgence on the lake below."



BYRON SPRINGS

39. BYRON SPRINGS

These excellent and already famous springs are pleasantly situated near the foothills in a spur of the Coast Range of mountains in Contra Costa County, about sixteen

miles southeast of Mt. Diablo and sixty-eight miles northeast of San Francisco, and about one and a half miles from Byron Station, on the railroad line from San Francisco to Stockton and Sacramento via Martinez. The springs lie in a small valley leading from the San Joaquin plains. The surrounding hills are composed of calcareous shales; the valley is covered with adobe clay and fine white sand, through which the springs bubble. About a quarter of a mile eastward from the springs a well has been sunk to a depth of 125 feet. The strata penetrated are coarse sand stone on the surface, and a conglomerate gravel, all bearing evidences of volcanic action. The gravel has been subjected to great heat and permeated with steaming gases from nature's laboratory below. The well contains about sixty feet of good water. The springs are among the many natural wonders in the State, and being centrally located and within easy access—only three hours from San Francisco—they are much visited by tourists. As a sanitarium, however, Byron ranks among the first in the State; invalids go to the Byron springs from all over the coast and many remarkable cures are ascribed to the waters. A large and commodious hotel has been constructed for the accommodation of about two hundred guests. Several handsome cottages for private and family use have recently been added. The architecture is after the fashion of the ancient and middle ages, inclosing between the building a large square laid out in parks and walks. Two sides of the square are formed by the hotel proper, a third side by the several bathhouses, and a fourth side by the cottages, forming quite a village, with picturesque surroundings. The *cuisine* is elegantly appointed, with an experienced *chef* at its head. A new dining-hall has recently been added. It is handsomely finished in paneled primavera and furnished with polished oak. Nourishing and appetizing viands are supplied in abundance and invalids are well cared for. The climate is mild and pleasant. Cool, balmy breezes spring

up from the tule lands every afternoon, making it pleasant even in the hottest day. The elevation is about one hundred feet above high tide.

Admirable as are the location and appointments, the chief excellence lies in the mineral springs. These became renowned many years before the Spanish invasion. Our Indians and Mexicans hand down traditions of the cures effected by the waters. The Indian used to travel many miles to bathe in the mud and drink the waters.

The springs and resort are now visited by thousands every year. Nothing succeeds like success, and these mineral waters have certainly achieved success.

During my visit to the sanitarium, in 1889, I counted more than fifty springs or outlets from the subterranean passages. Some are cold and others are hot, ranging from 52° F. to 140° F. Within a few feet of each other there will be a cold carbonated spring and a hot sulphureted spring. The whole basin has the appearance of being an extinct volcanic crater. The cold soda springs come from the surface water, but the hot water—sulphurous—must

come from a considerable distance down in the earth's crust. Chemical metamorphosis could probably not produce the amount of heat found at Byron.

There are also several inflammable gas-wells or springs, two of which have been developed by sinking about thirty feet and erecting small receivers over them. I burned the gas for fifteen or more minutes and found it to consist largely of carbureted hydrogen (CH_4). The supply seems inexhaustible, amply sufficient to heat and light the entire resort. Special gas receivers, etc., for the utilization of this valuable natural product will shortly be erected and then Byron will be illuminated with natural gas.

Of the fifty or more mineral springs only seven or eight are in active use. One of the most important of these is the "liver and kidney" spring. It is so named on account of the action of the water on these organs. This spring was used by many people prior to the occupancy of the place as a resort. For miles around they used to come and carry away the water in bottles and barrels and use it medicinally.

The following analyses were made in the early part of 1889:

BYRON SPRINGS—"LIVER AND KIDNEY SPRING"

HEAVY SALINE WATER

DR. WINSLOW ANDERSON, Analyst, 1889

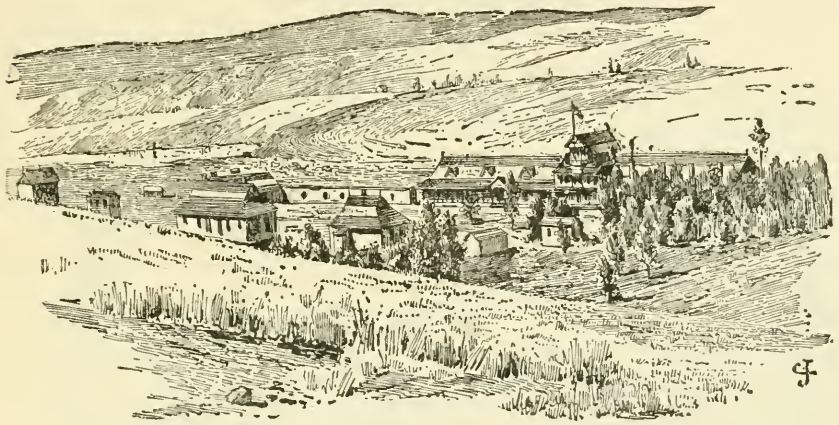
Temperature 66° F.

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains
Sodium Chloride	622.07	Calcium Sulphate	1.12
Potassium Chloride	33.74	Calcium Carbonate	.59
Potassium Iodide	.79	Barium Carbonate	.93
Potassium Bromide	trace	Ferrous Carbonate	.72
Magnesium Chloride	3.92	Ammonium Chloride	3.05
Magnesium Carbonate	15.75	Silica	1.00
Calcium Chloride	85.37	Organic Matter	trace

Total Solids, 769.05

Gases	Cubic Inches
Free Carbolic Acid Gas	7.82

This has proved a most valuable water in dyspepsia, chronic hepatic diseases, obstruction to the gall ducts, and what is known as "gin livers." The action also extends to torpidity of the bowels. It is exceedingly diuretic, and has a record of curing several cases of albumenurea (Bright's disease). Its action also extends to the mucous membranes of the nose, throat and lungs. A glassful taken before breakfast acts agreeably on the stomach, liver and kidneys and intestinal tract, assisting the process of elimination, secretion and excretion of morbific



BYRON SPRINGS

and waste material in the visceral and cutaneous systems. In alcoholic dyspepsia it is very beneficial. Gentlemen whose acquaintance with, and long, assiduous devotion to Bacchus, which has at last, as must of necessity follow such friendships, resulted in a worn-out gastric mucous membrane, with atonic or catarrhal dyspepsia and shattered health, will find wonderful improvement in a month's sojourn at Byron by using the "Liver and Kidney" water.

Long before my chemical analysis had been made of this "Liver and Kidney Spring" water it was extensively used by alcoholics whose stomachs, livers and kidneys were diseased. Several people in Sacramento who had albumen in their

urine from this cause were entirely relieved by the use of the water. Thus practice stepped in and demonstrated a fact before science had had a chance to announce it.

Quite a contrast to this heavy saline water is the spring known as the

BYRON SPRINGS—"WHITE SULPHUR SPRING"

LIGHT ALKALO-SULPHUROUS WATER

DR. WINSLOW ANDERSON, Analyst, 1889

Temperature 76° F.

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains
Sodium Chloride	12.01	Magnesium Carbonate	2.50

Sulphureted Hydrogen	5.80

This light alkalo-sulphurous water is palatable and invigorating, containing a large quantity of ferruginous salt, so necessary in strumous diathesis, rheumatism, gout, chronic malarial poisons, cutaneous diseases, etc., etc. Its action is tonic, diuretic, alterative, aperient and antacid. Its use is indicated in acid blood or acid urine, or diseases having or depending upon these pathological conditions, such as rheumatism, chronic joint diseases, glandular enlargements and many forms of skin diseases. It should be taken between meals in six to eight ounce doses.

BYRON SPRINGS—"BLACK SULPHUR"

HEAVY CHLORINATED SULPHUROUS WATER

DR. WINSLOW ANDERSON, Analyst, 1889

Temperature 90.3° F.

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains
Sodium Chloride	395.00	Calcium Chloride	9.00
Sodium Sulphate	trace	Calcium Sulphate	3.20
Sodium Bicarbonate	trace	Calcium Carbonate	5.95

Magnesium Carbonate	9.50		

Total Solids, 461.97

Gases	Cubic Inches
Carbonic Acid Gas,	25.60
Sulphureted Hydrogen,	8.00

The action of the water is largely diuretic, as it contains considerable quantity of the chlorides and carbonates and a large amount of carbonic acid gas. It is indicated in catarrhal irritation and inflammation of the genito-urinary tract, and has proved of service in Bright's disease, cystitis, acid dyspepsia and constipation.

The water is largely used for bathing purposes. Used internally, it should be taken one hour before meals.

The "Black Sulphur" water is an excellent alterative, containing potassium salts so valuable in scrofulous and blood glandular diseases. This water is much used for bathing purposes.

BYRON SPRINGS—"IRON SPRING."

ALKALINE AND CHALYBEATE WATER

Dr. Winslow Anderson, Analyst, 1889

Temperature 79.5° F.

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains
Sodium Chloride	670.43	Calcium Chloride	9.75
Sodium Sulphate	trace	Calcium Sulphate	10.80
Sodium Carbonate	trace	Calcium Carbonate	6.03

Potassium Bromide	trace	Ammonium Chloride	trace
Potassium Iodide	.04	Silica	2.29
Magnesium Chloride	1.82	Organic Matter	.06
Magnesium Carbonate	15.94		

Total Solids, 765.64

Gases	Cubic Inches
Carbonic Acid Gas,	25.00
Sulphureted Hydrogen,	12.95

This spring has been in extensive use for many years. When the Indians bathed in the hot sulphurous mud springs centuries ago they are also supposed to have drank the iron water. For years invalids have used this water as a cure for fever and ague and malarial chills. Its action is tonic, diuretic, antacid and laxative, and is used with success in anæmia, chlorosis, loss of appetite, want of strength, malarial toxæmia and allied diseases tending to destroy the vitality of the red-blood corpuscles and the organs presiding over their manufacture. It is a significant fact that although this spring contains considerably less than many other springs on the premises, yet the "Iron Spring" water is more tonic and invigorating. The secret lies in the kind of iron in the spring. Here it will be observed to be a *peroxide*. As the noted authority on mineral springs, Dr. Sigismund Sutro, of London, remarks (see therapeutics of mineral waters in front part of this book), you may understand why six-tenths of a grain of iron imbibed into the duodenal lacteals (absorbent vessels in the intestines just beyond the stomach), with the abundance of the gaseous (carbonic) acid, may exercise a greater influence on the circulating system than three or four times the quantity

of pharmaceutical carbonate of iron, which has to be dissolved in the gastric juice previous to absorption, hence it is that this spring has been so valuable and so extensively used long before any chemical analysis had been made of it.

BYRON SPRINGS—"HOT SALT"

ALKALO-CHLORINATED

Dr. Winslow Anderson, Analyst, 1889

Temperature 122.3° F.

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains
Sodium Chloride	555.26	Calcium Carbonate	.68
Sodium Carbonate	0.21	Calcium Sulphate	.85
Potassium Chloride	36.02	Ferrous Carbonate	.86
Potassium Bromide	trace	Ammonium Chloride	.09
Potassium Iodide	0.03	Barium Carbonate	.17
Magnesium Chloride	2.06	Silica	2.00
Magnesium Carbonate	12.11	Organic Matter	.06
Calcium Chloride	96.54		

Total Solids, 706.94

Gases	Cubic Inches
Free Carbonic Acid Gas	3.00

The "Hot Salt" water is used for bathing. It has a temperature of 122.3° F. The water is alkalo-chlorinated, of a good specific gravity to be readily absorbed into the cutaneous system (see article on bath). The potassium salts and other mineral ingredients, principally chlorides, make the water diuretic, detergent and alterative. It has been drank and bathed in with marked success in rheumatism, gout and joint diseases, cutaneous affections, etc., etc.

BYRON SPRINGS—"IRON PIPE"

ALKALO-CHLORINATED

Dr. Winslow Anderson, Analyst, 1889

Temperature 76° F.

Mineral Ingredients	U. S. Gal. contains Grains	Mineral Ingredients	U. S. Gal. contains Grains
Sodium Chloride	594.10	Calcium Carbonate	.29

Total Solids, 18,773.73

Gases

Free Carbonic Acid Gas ..... trace

The "Surprise" water is indeed a wonderful spring. The most careful analysis yields over 15,000 grains of common salt to each gallon of 231 cubic inches of water, and has over 18,000 grains—about 40 ounces, or 33 per cent.—of solid mineral ingredients in solution in the water. Comparative analyses of heavy waters show the "Surprise" to be the most remarkable.

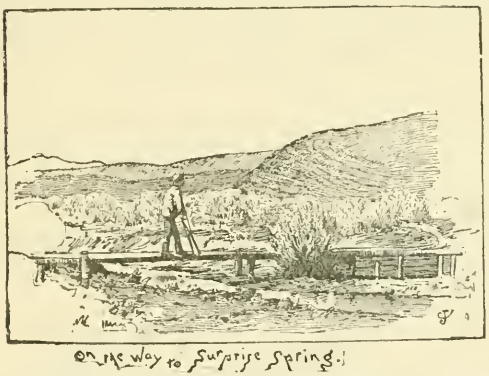
Total Solids	U. S. Gal. contains Grains	Total Solids	U. S. Gal. contains Grains
Sea Water	2,138.91	Salt Lake (Utah)	about 11,000.00
Mono Lake (Cal.)	2,915.16	Michigan Salt Wells	11,665.00
Castalian Min. Sp. (Cal)	4,422.25	Dead Sea (Holy Land)	13,488.10
Owens Lake (Cal.)	7,000.60	Byron Surprise Spring	18,773.73
Syracuse (N. Y.) Salt W	9,221.00		

For bathing purposes this "Surprise" water ought to be one of the most valuable on the coast, as the absorption is in direct ratio to the specific gravity of the bath. (See article on the bath at the beginning of the volume.)

The water is highly diuretic and laxative when taken internally.

The bathing facilities at Byron are a special feature. Two large bathhouses have been built, and baths, either sulphurous, steam, vapor or water, in tub or plunge, can be taken at all temperatures.

The hot saline and sulphur waters are used with considerable success. But the most noted of all the baths are those of moor or mud. They are so constructed that complete immersion can be secured and the temperature regulated to suit each case. The baths can also be partial if desired. These baths are all taken in individual bathtubs, and the mud is changed after each bath. This hot sulphurous saline mud has become famous in the treatment of rheumatism, gout, swollen joints, chronic arthritis, scrofula, skin diseases, etc., etc. In several cases of chronic rheumatism the writer can attest to its beneficial effects. The "Hot Salt" water has proved superior to almost any other uterine douche in the treatment of leucorrhœa and inflammation of the pelvic organs. (See uterine douche.) The following is an analysis of the sulphurous mud and water used for bathing:



On the way to Surprise Spring.

BYRON SPRINGS—"BLACK SULPHUROUS MUD"

SALINO-SULPHUROUS MUD WATER

Dr. Winslow Anderson, Analyst, 1889

Temperature 110° F.

Mineral Ingredients	U. S. gal contains Grains	Mineral Ingredients	U. S. gal. contains Grains
Sodium Chloride	274.93	Calcium Chloride	7.50
Sodium Sulphate	42.16	Calcium Sulphate	36.05
Potassium Chloride	26.40	Calcium Carbonate	3.09
Potassium Iodide	0.32	Ferrous Sulphate	0.76
Potassium Bromide	trace	Ammonium Chloride	trace

Magnesium Sulphate	19.60	Organic Matter	7.34

Total Solids, 425.83

Gases	Cubic Inches
Free Carbonic Acid Gas	17.75
Free Sulphureted Hydrogen	14.50

This mud is used for bathing purposes by thousands of rheumatics every year, and it certainly has considerable therapeutic value as an auxiliary in the treatment of many of these cases.

40. CALIFORNIA SELTZER

These springs are pleasantly located in the Coast Range of mountains, twelve miles from Cloverdale, in Mendocino County. The surroundings are picturesque, and the climate is good. There is a comfortable resort at the springs.

The waters are sparkling and carbonated and of especial benefit in dyspepsia with acid eructations, constipation, acid conditions of the urine, cystitis, etc. The waters are diuretic and aperient, and highly charged with carbonic anhydride. They are quite palatable.

On analysis the seltzer is found to contain:

41. CALISTOGA MINERAL SPRINGS

These valuable mineral springs are situated in Napa County, nine miles south of Mt. St. Helena. There are two sets of springs—one set in the city of Calistoga and another set just outside the town. They are about the same in composition, so that one description will do for both.

In 1858 Mr. Samuel Brannan purchased the springs and a large tract of land. He expended about $100,000 on the place, built an elegant hotel and twenty fine cottages, erected handsome and excellent bathing facilities, and had in the course of a few years one of the finest resorts on the coast. In 1868, ten years later, the hotel and several of the cottages burned down, and since that time the place has changed hands many times. We learned during our visit to the springs last year that Senator Stanford now owns the premises, and contemplates restoring the once handsome resort. The mineral springs number some twenty or more. They range in temperature from 75° F. to 186° F. The waters are used for drinking and bathing purposes, and have acquired considerable reputation. Dr. Alden M. Gardiner, one of the leading physicians in Calistoga, informed the writer that he had used the waters with considerable efficacy in many obstinate cases of syphilitic contamination, rheumatism, etc. From what I saw of the place I should judge that it could be made a first-class sanitarium for chronic cutaneous diseases, rheumatism, scrofula and constitutional taints.

42. CAMETA WARM SPRINGS

Lie in township 29 S., range 17, Mt. Diablo M. Unimproved.

43. CAMPBELL'S HOT SPRINGS

These springs are located in Sierra County, one mile from the town of Sierraville. There are three principal springs, one of which is cold and the other two hot, having a temperature of 104° F. The surrounding scenery is grand and a first-class resort has been established there. The elevation is 5,025 feet; climate, during the summer season, is fine. There is good fishing and splendid hunting in the immediate neighborhood.

The waters are slightly saline and mildly sulphurous, and used for the same diseases that such mineral waters seem to help.

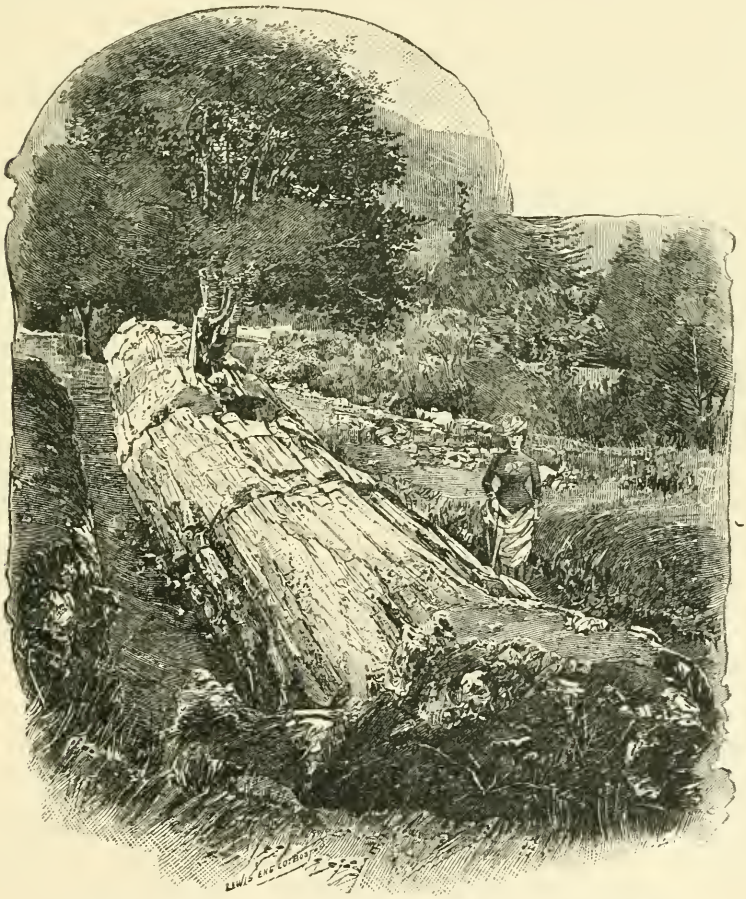
44. CAMPO'S CHALYBEATE SPRINGS

Not developed, and I have been unable to obtain water for analysis.

The Petrified Forest

Near Calistoga, situated in the adjacent mountains, and forming an interesting study for the tourist and scientist, is the petrified forest grotto, composed entirely of the trunks and limbs of trees. Much has been written concerning the origin of this wonderful forest, which may have been submerged in distant ages by the eruption of some volcano, discharging water and ashes, covering it and sealing it in an eternal tomb. Ages gradually exhumed it in the original form, but turned to stone. The area covered is about twenty acres, and is well worth a visit.

There are about one hundred trees and traces of trees, all lying in the same general direction, having been thrown down from north to south, the largest of which is called the "Pride of the Forest," and is sixty-seven feet in length and nearly twelve feet in diameter.



SCENE IN PETRIFIED FOREST, NEAR CALISTOGA, CALIFORNIA

45. CARBONATED SPRINGS

Located on Shovel Creek road, in the northern part of Siskiyou County. They are used locally and are said to have a very agreeable soda taste. Unimproved.

CARNELIAN, OR LAKE TAHOE HOT SPRINGS

See Lake Tahoe springs.

47. CASA DIABLO HOT SPRINGS

These hot springs lie about ten miles east of Mammoth, in Mono County. They are on the road to Burton. The waters are saline and sulphureted. Farther up the road are found a number of small steaming, boiling geysers, issuing from small crevices in the igneous rock. They spout up with considerable force. The temperature of these sulphurous springs is near the boiling point. Unimproved.

48. CASTALIAN MINERAL WATER SPRINGS

These are found near Owen's Lake, in Inyo County. They number thirteen, mostly cold. One or two are sulphurous and the others are alkaline and carbonated. A resort is building up about the springs. Some of the water is also used commercially for the curing of cutaneous affections.

The following analysis was made by Prof. Price in 1880:

CASTALIAN MINERAL WATER

THOMAS PRICE, Analyst, 1880

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains
Sodium Carbonate	1724.11	Silica	14.28
Sodium Sulphate	651.02	Boracic Acid	trace
Sodium Sulphate	46.34	Phosphoric Acid	trace
Sodium Chloride	1840.72	Iodine	trace

Lime	trace	Iron	trace
Magnesia	trace	Organic Matter	13.48

Total Solids, 4422.25

Gases not determined

This is one of the heaviest waters we have on the coast, and is much too dense to use medicinally, it could, however, be used very much diluted. We are informed that there are several other springs not so dense as this one, which are used medicinally.

49. CASTLE ROCK SPRINGS

On the Mt. Shasta scenic route are situated several sulphureted and carbonated soda springs, known as "Castle Rock." They lie near the foot of Mt. Shasta. They are used locally for rheumatic troubles.

50. CHALYBEATE MINERAL SPRINGS

Unnamed springs of iron, soda, magnesia, etc., are found in several portions of the State. Several of these are in Tehama County, about two miles from Tom's Head Mountain. They have gained a local reputation in chronic malaria, anæmia, etc., chlorosis, hemorrhages, etc. There are no improvements on the grounds yet, and no analysis has been made. Other Chalybeate springs are located in Shasta County, northwest of Fort Crook on Bear Creek, near the head of Falls River. These springs are reported to be highly ferruginous. The water is said to be pleasant to the taste, sparkling and carbonated. Unimproved.

COAL.—Extensive coal beds are found in various parts of the State.

COAL OIL SPRINGS.—See petroleum.

51. COAL VALLEY BOILING SPRINGS

These hot springs lie some eight miles west of Canby, in Modoc County. They are truly boiling, having a temperature of 214° F. An egg boils in the water in a few minutes. White incrustations of soda form about the margins of the springs. The property is unimproved.

52. COLD SODA LAKE

This alkaline sheet of water is found near the head of Mill and Battle Creeks, south of Lassen's Peak, in Plumas County. The Lake is fed by many small springs bubbling up all over its bottom. The water is palatable and sparkling, and the location will no doubt develop into a resort before long. The water is found to contain:

Sodium Chloride.
Sodium Bicarbonate.
Sodium Carbonate.
Potassium Bicarbonate.
Magnesium Carbonate.
Calcium Carbonate.
Free Carbonic Anhydride.

53. COLD SODA SPRINGS

These delicious springs are located near the Yosemite Valley, in Tuolumne County. The springs, though unimproved, are much visited by tourists, who drink the water with decided relish. By adding sugar or syrup to these alkaline and carbonated waters a genuine soda may be prepared.

54. COOK'S SPRINGS

Located in Indian Valley, Colusa County, some thirty-two miles from Williams. The waters are saline and sulphurous, acting pleasantly on the liver and bowels. They are used locally.

"The waves come crowding up on the shore like nymphs in silv'ry green;
Forward in line they trip to the time of orchestras unseen.
They sport and leap by the rocky point, sparkling in gems and gold,
Murmuring ever a liquid strain, like siren songs of old.
With snowy plumes, which wreathe and curl and toss in wanton glee,
Their riotous dance brings to the heart the gladness of the sea!
Oh! the sea seems in a happy mood—happy! and so am I,
With heart as light as the foamy crest of waves that jostle by!"

THE HOTEL DEL CORONADO NORTH-WESTERN VIEW

55. CORONADO MINERAL SPRINGS

In San Diego County and on the Coronado Beach are located some excellent mineral waters. The springs are at an elevation of thirty feet above the ocean tide, and flow the enormous amount of 50,000 gallons per hour. The water is clear and sparkling, pleasing to the eye and pleasant to the taste, being soft, pure and wholesome.

On analysis it is found to compare favorably with the noted Waukesha Water of Wisconsin, the Betheseda Spring, as follows:

CORONADO SPRINGS

LIGHT ALKALO CARBONATED WATER

C. GILBERT WHEELER, Analyst

Mineral Ingredients	SAN DIEGO U. S. gal. contains Grains	BETHESDA, WIS. U. S. gal. contains Grains
Sodium Chloride	10.168	1.160
Sodium Carbonate	——	.872

The waters are gently aperient, diuretic and tonic, of value in dyspepsia, anæmia, renal and cystic disorders. The accommodations at the Coronado Hotel are among

the finest in the world. The building is a magnificent structure, and the scenery on the beach, on the banks of the grand Pacific Ocean is never to be forgotten by one fortunate enough to have beheld it.

56. CORRAL DE LUZ WARM SPRINGS

These noted springs are found in San Diego County, near Oceanside. They are pleasantly located in a valley about two miles in diameter, with mountains on all sides; about eight miles from the ocean. Sycamores, oaks and alders are scattered in wild profusion about the springs. There is only a small resort at these springs at present, owing, no doubt, to the fact that an old gentleman nearly eighty years of age, owns the place. The climate is delightful, having a temperature of 70° F. to 85° F. Winter and Summer.

The de Luz Springs—several in number—from their surroundings and natural advantages offer a sanitarium second to none in the State. The temperature of the water ranges from 85° F. to 135° F., and all the place needs is some live man with a little capital to develop the country and build up a first-class resort. The waters are highly charged with sulphur and sulphurous acid, sulphates of magnesia, soda and calcium.

Crude baths are arranged and several small cottages are for hire. The place is much frequented by Spaniards and Mexicans, and the usual number of diseases are treated by the baths and sulphur waters.

57. CRYSTAL SPRINGS

Several carbonated-alkaline waters are found in Napa County and known as "Crystal Springs." The water is used by the people in the vicinity. No improvements.

In San Mateo County we find several more mineral springs named "crystal." The waters are reported to be

alkaline and saline, acting on the stomach, bowels and kidneys. It is a favored remedy in the neighborhood for "biliousness."

58. CUYANA HOT SPRINGS

These springs are also sulphurous, and located in the cañon and valley of Cuyana in Santa Barbara County. There is no analysis.

59. DESERT OR CAVE SPRINGS

These are located in Kern County, and consist of alkaline carboneted waters with borates. Unimproved.

60. DR. SOUPAN'S HOT SPRINGS

We find these hot sulphur springs at the head of the road on a branch of Battle Creek, in Plumas County. The surroundings are picturesque, and we understand improvements are contemplated. No analysis.

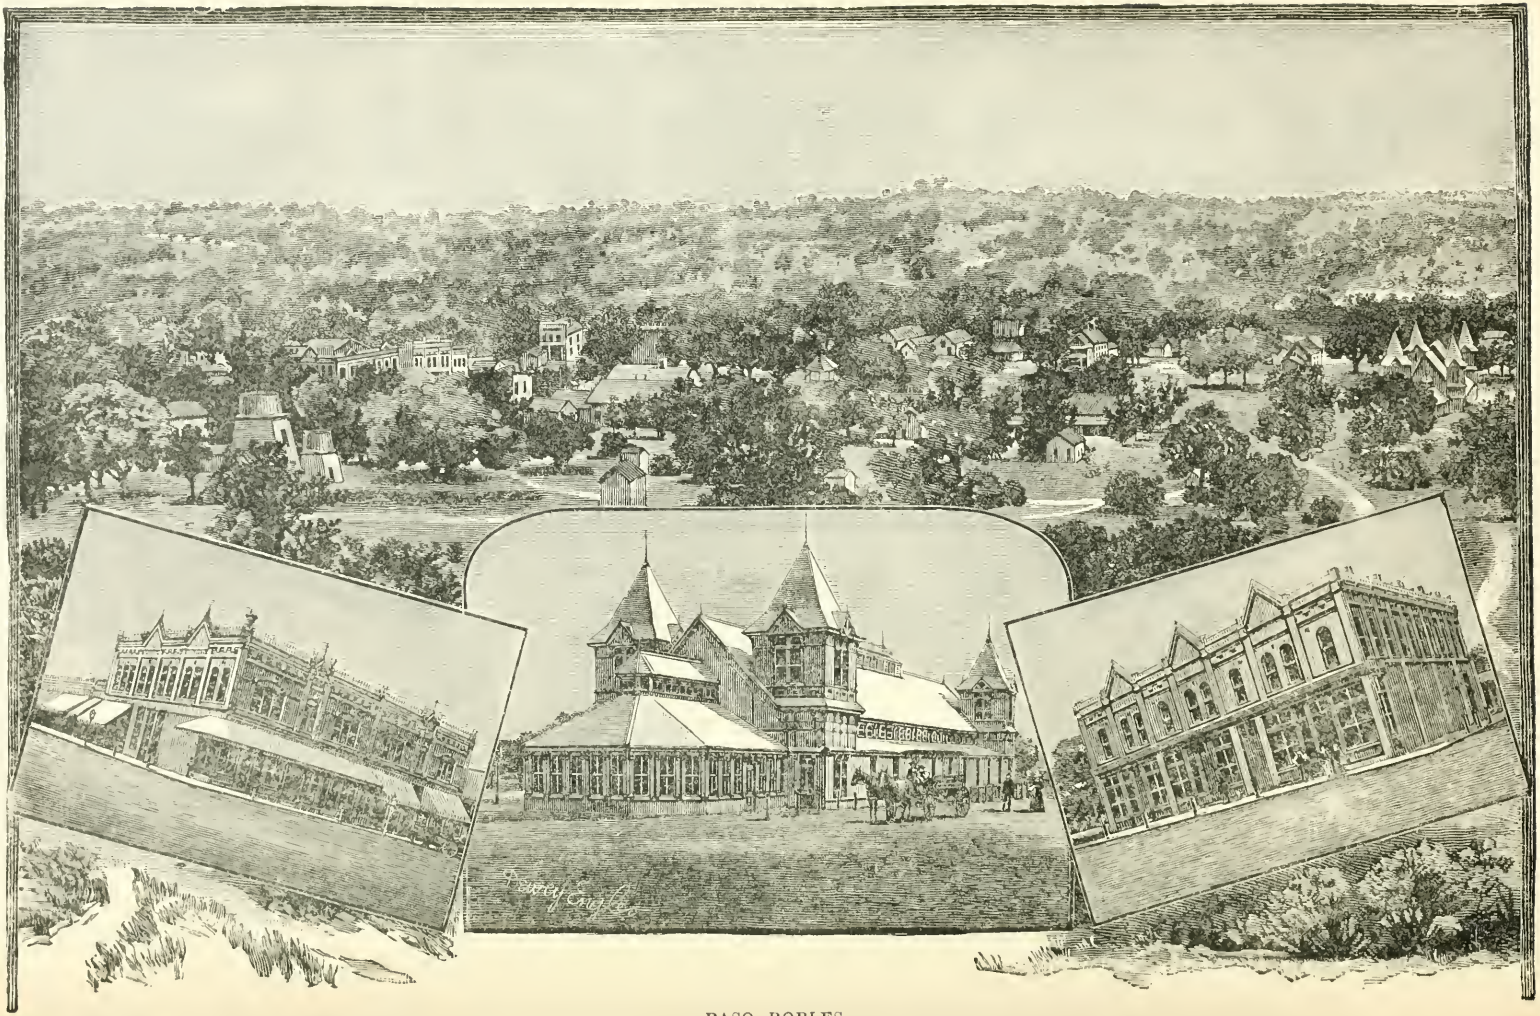
DE LUZ SPRINGS

See Corral de Luz warm springs.

El Paso de Robles

HOT AND COLD SULPHUR SPRINGS

These valuable mineral springs are situated midway between the mission of San Miguel Archangel and La Casa del Paso de Robles. They lie in the beautiful valley of the Salinas River about sixteen miles from the shores of the Pacific and two hundred and sixteen miles from San Francisco. The springs are of easy access by the Southern Pacific Railroad (northern division) via Soledad, through trains daily. Also from San Luis Obispo by stage. The name, El Paso de Robles (ail-parso day roh-blais) is derived from the Spanish, meaning "in a pass of the oaks," from



PASO ROBLES

the fact that the main highway ran through this valley. For many miles this picturesque valley is covered with gigantic white oaks, live oaks and huge cottonwoods, and nestled in one of these cosy groves is Paso Robles retreat.

The once wild "pass in the oaks" is now transformed into a blooming resort, with cultivated grounds, and Paso Robles is a delightful little town of about one thousand inhabitants. It is situated in the center of a very rich agricultural section in San Luis Obispo County. The town is principally built of handsome brick buildings and is growing rapidly. When the Southern Pacific Railroad is completed Paso Robles will be of considerable commercial importance.

Near the springs, and overlooking the prosperous little town, there is in course of construction an elegant and commodious hotel, which is to be built of solid brick throughout. This building, when completed, will not only be an ornament to the town, but of great comfort and convenience to the many guests who go to the springs yearly for their health.

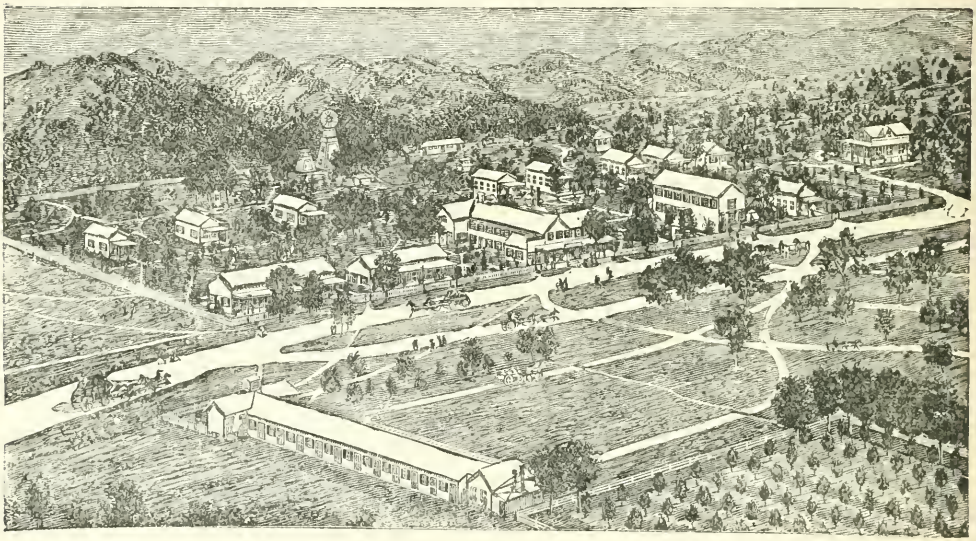
Under the umbrageous oaks in different parts of the extensive grounds are located some eighteen cosy cottages for private and family use. On each side of the resort and valley the evergreen hills, covered with forests of pine, oaks, manzanita groves and sweet-scented shrubbery, form a pleasant contrast to Paso Robles proper. The climate is remarkably mild and luxurious all the year round, and the atmosphere is pure, balmy and invigorating.

Few mineral springs in America have acquired such a favorable reputation for the treatment of constitutional contaminations, rheumatism, gout, joint, blood, glandular and cutaneous diseases as Paso Robles have, and thousands go there yearly to receive the joint benefit of the bathing and drinking waters, as well as the internal medical treatment.

The waters at Paso Robles are sulphurous and alkaline, ranging in temperature from 59° F. to 104° and 122° F.,

and comprise the "Main Hot Sulphur" spring, the "Mud or Moor" springs, the "Soda," "Sand," "Cold White Sulphur," "Iron" and "Garden" springs.

The great hot sulphureted spring is located about three hundred yards from the hotel in a southeasterly direction. Over it has been constructed one of the finest bathing establishments on the coast, consisting of sixty individual bathtubs, and a large vat fifteen by thirty feet for a swimming or a plunge bath. One side is used for women and the other side for men. Immediately over the source of the spring is



built a large dome-shaped receptacle twenty-five feet in diameter and about twenty feet high. This tank collects the hot water and gases as they issue from the subterranean laboratory, and, being constructed of solid masonry and hermetically sealed, all the vapors and mineral properties are kept saturated in the water. From this tank or reservoir lead several faucets, whereby the water may be drawn for drinking purposes. Most of the water, however, is used for bathing, for which purpose it is led into the several bathtubs.

The flow of this main spring is about 5,000 gallons per hour, and it has a temperature from 105° F. to 110° F.

EL PASO DE ROBLES—"MAIN SULPHUR WATER"

ALKALO-SULPHUROUS

Flows 5,000 gallons per hour

These waters are found to be especially serviceable in acute and chronic rheumatism and articular affections, scrofula, blood, glandular and cutaneous diseases. In catarrh of the naso-pharynx the water, used as a hot douche, has proved highly beneficial, likewise in leucorrhœal discharges and engorgement of the pelvic organs, etc., etc.

It is important, as has been remarked when speaking of the therapeutic properties of mineral waters, to carefully follow the instructions of the resident physician, in order to fully and rapidly receive the benefits of the springs. Con-

nected with Paso Robles is an experienced physician, Dr. David L. Deal, who has made a special study of the action of these waters in health and in disease, and his instructions should be conscientiously followed.

The next most important water at Paso Robles is that used for the mud or moor baths. This now famous spring is situated about one mile and a half north of the hotel, near the line of the Southern Pacific Railroad and on the edge of the Salinas River.

The walk from the hotel to this spring is a pleasant one under the shady oaks and along the well-kept road and grassy lawns. Patients unable to walk, and others who may desire it, can ride in the hotel carriage to and from the mud baths twice daily.

These mud springs—for there are several—cover a space of about twenty-five feet square, over which has been constructed suitable bathing conveniences, consisting of dressing-rooms, hot sulphurous water plunges and the mud plunge. This latter is a compartment or vat four by eight feet and nearly filled with prepared moor or mud, and so arranged that the hot sulphurous water and gases rise directly into it from the ground beneath.

The facilities are admirably arranged for both ladies and gentlemen, and competent persons administer the baths under directions of the resident physician.

During my visit to these springs, in 1889, I found the temperature of the mud and sulphurous waters to vary from 104° F. to 122° F. Baths are prescribed once, twice or three times a week of different degrees of temperature and of varying duration, to suit each individual case. The mud springs flow collectively about 6,000 gallons per hour.

Moor bathing has been practised by the Indians for generations, and of late years it has been extensively introduced among the white people all over the world. These baths at Paso Robles have gained considerable celebrity, and justly so. The writer has had occasion to note the beneficial results in many cases subjected to this plan of

treatment and he does not hesitate in remarking that for rheumatism, arthritis, stiff joints, sprains, white swellings (synovitis), glandular enlargements, chronic cutaneous diseases, etc., much benefit will accrue, especially if the internal medication be kept up during the treatment.

EL PASO DE ROBLES—"MUD SPRINGS"

SULPHUROUS

This soda water is found to be of special value in kidney and bladder irritation.

"SAND" SPRING

About one-quarter of a mile south of the mud springs we find a large "sand" spring. It is about twelve feet in diameter, and situated in the old bed of the Salinas River. The waters are carbonated and sulphureted and bubbling up with considerable force, carrying with it quantities of white silicon oxide, which sparkles in the water as it rises and falls.

The waters have a temperature of 79.1° F., and are not utilized to any extent at present.

61. ELSINORE SPRINGS

Near Elsinore, in San Diego County, lies a little valley, which is teeming and steaming with mineral springs. Some are hot and others are cold. They number some two hundred. The temperature ranges from 57°F. to 212° F. The cold springs are carbonated, containing soda, magnesia and iron; the hot waters are sulphurous, with lime, magnesia and borax. There are also hot mud springs. The place is not developed. We predict a large resort for the valley in the course of a few years.

62. EUREKA SPRINGS

These springs are located in Humboldt County, near the town of Eureka, and they issue from the bank of the Bay. The waters belong to the chlorinated-sulphureted class, and were analyzed by Professor W. D. Johnston in 1885, as follows:

EUREKA SPRINGS

CHLORINATED—HEAVY

PROF. W D. JOHNSTON, Analyst, 1885

Mineral Ingredients	U. S. gal contains Grains	Mineral Ingredients	U. S. gal. contains Grains

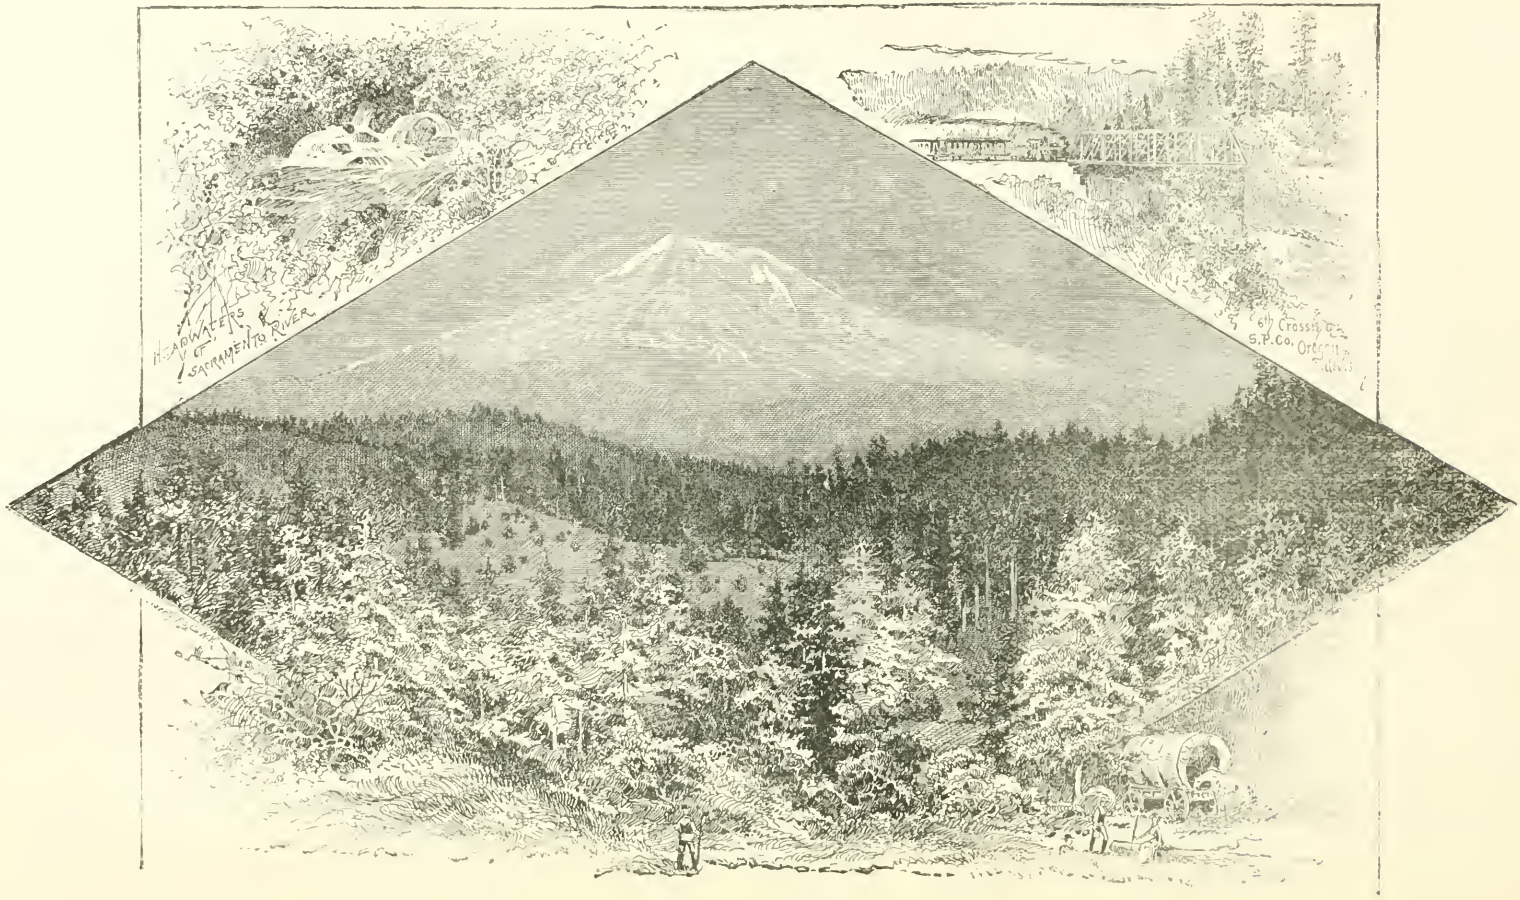
Carbonic Acid Gas.....small amount

Sulphureted Hydrogen.....saturated

This Eureka Spring water is now extensively used by the inhabitants. It is also shipped to San Francisco. The action of the water is laxative and diuretic, acting also on the glandular and lymphatic systems. It has also been used in skin diseases.



MT. SHASTA

FAIRMOUNT MINERAL SPRINGS

These recently developed springs are located in Sonoma Valley, about five miles from Cloverdale.

The water is alkaline and carbonated, very palatable and has a pleasant antacid effect on the stomach. The building of a resort is contemplated.

FELT'S MINERAL SPRINGS

These springs are located in Humboldt County, about twenty-five miles from Eureka, near the head of Strong's Valley. There are quite a number of springs on the place, the most important of which yields, on analysis:

Sodium Chloride.	Magnesium Chloride.
Sodium Carbonate.	Magnesium Carbonate.
Potassium Chloride	Calcium Carbonate.
Potassium Carbonate.	Manganese.
Potassium Sulphate.	Traces of Iron.
Silica.	Alumina.

The grounds are elegantly laid out, and commodious quarters have been erected for the accommodation of guests. The resort is illuminated by natural gas from the premises. The waters are said to be beneficial in dropsical tendencies depending on the liver or kidneys.

65. FRESNO HOT SPRINGS

Located near Warthan, in Fresno County. Unimproved.

66. FREY'S SODA SPRINGS

These springs lie near the line between Shasta and Siskiyou Counties. The waters are alkaline and carbonated. Temperature 52° F.

67. FULTON WELLS

This resort is located in Los Angeles County, about three miles north of Norwalk Station, on the Los Angeles Railroad, and thirteen miles from Los Angeles City. The wells were bored by Dr. Fulton, a very intelligent physician, who conducts the sanitarium himself. The two principal wells are 350 feet deep and flow copiously. The waters are carbonated and sulphurous, and contain:

FULTON WELLS—350 Feet Well
CARBONATED AND SULPHUROUS
DR. WINSLOW ANDERSON, Analyst, 1888

Total Solids, 81.13

Gases

Free Carbonic Acid Gas.....excess
Free Sulphureted Hydrogen.....excess

Comfortable cottages, a large hotel and excellent bathing facilities have been erected, and the resort enjoys considerable reputation in the treatment of anæmia, malarial troubles, atonic dyspepsia, congestion of the liver, etc. It will be observed that the waters contain a very large percentage of iron salts.

CALIFORNIA GEYSERS

This marvelous region—this branch of Hades, nestling among the umbrageous oaks and firs in the pine-clad mountains, rich in manzanita groves, sweet-scented shrubbery and wild flowers, and surrounded on all sides by his Satanic Majesty's prodigious laboratory—is located in the northeastern part of Sonoma County, about one hundred miles north of San Francisco, sixteen miles from Clover-

BIRDS EYE VIEW OF THE GEYSERS, SHOWING HOTEL & COTTAGES

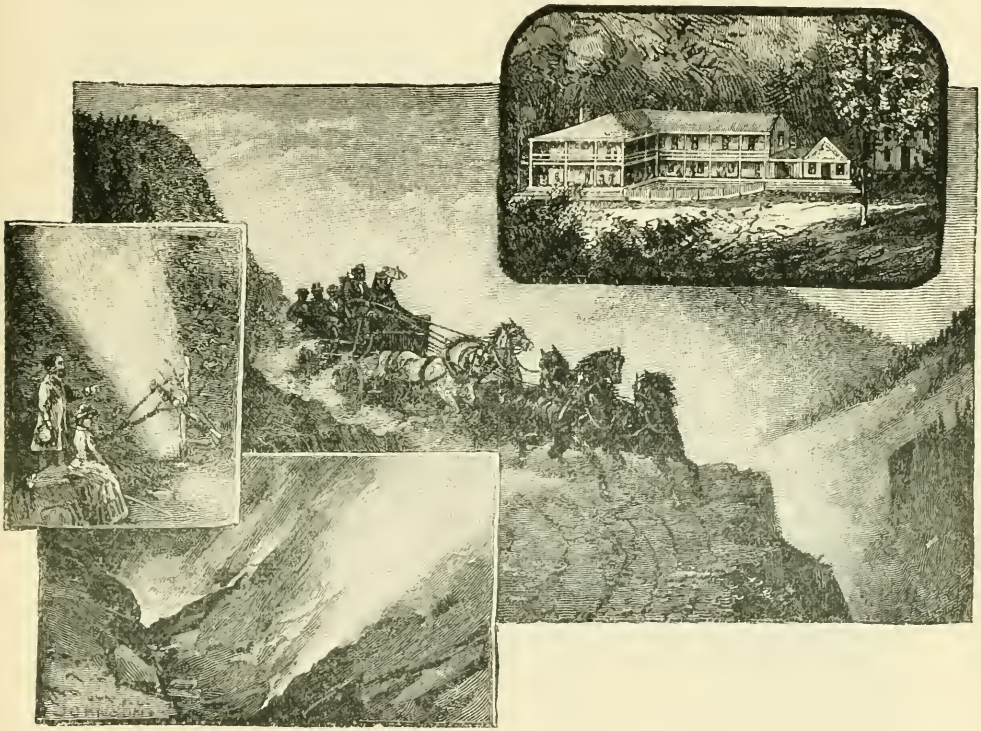
dale, and twenty-six miles from Calistoga. This Plutonian realm was discovered in 1847 by Mr. William B. Elliot. One day while out hunting in that section of the country he scaled the northern mountain overlooking this partially extinct volcanic region, and came suddenly upon this wonderful scene. Imagine his fear and astonishment at beholding for the first time the Geysers! He remained awestruck for a few moments, and then hastened away to inform his companions that he had discoverd the very mouth of the infernal regions!

Since that time to the present these famous springs have been the objects of wonder and admiration to all the many thousands who visit them yearly.

Formerly tourists rode on horseback for many miles up the narrow mountain trails to visit this natural wonderland, which is situated about 1,700 feet above the sea level, but, thanks to the push and enterprise of western civilization, we now travel in comfortable six-horse stages from the termini of the Cloverdale and Calistoga railroads over excellent mountain roads to the geysers. It is a good plan to go by way of Cloverdale and return by way of Calistoga, as you then see all the grandeur and beauty of the surrounding country.

Leaving Cloverdale after luncheon, comfortably seated in your stage, with an experienced and accommodatingly communicative driver, who takes pleasure in pointing out the many objects of interest, you soon cross the Russian River and commence the ascent. The hills and mountains are robed in evergreen verdure of indigenous flora, gigantic oaks and towering pines. Here and there the huge boulders and rocky cliffs stand out in bold relief, and as you wind up and around the mountain sides, with the Pluton River many hundred feet below, basking and smiling in the afternoon sun and rippling along its moss-covered banks and bright-pebbled bottom, with here and there a miniature cascade and waterfall, you feel that words cannot describe the grandeur of the scenery. The elevated roads

on the mountain slopes frequently bring you to a sharp curve, where the view is unobstructed, and where the stage-driver is afforded an excellent opportunity of showing his skill in handling the six-in-hand. Now and again the road turns so sharply that the "leaders" are out of sight before the curve is rounded.



CALIFORNIA GEYSERS

As you gain in altitude the view becomes more and more extended until your eyes leap like live thunder from peak to peak and valley to valley for miles around, feasting upon the beauties of nature.

Some two or three miles down the cañon, before you reach the Geysers, your attention is called to the large white, or yellowish-white, banks across the cañon. They are known as "sulphur" banks and consist of deposits of sulphur and cinnabar with incrustations of salts of sodium,

potassium, magnesium, sulphur, etc. They are extinct craters, or the deposits of geysers and fumaroles which have died out, leaving evidences of volcanic action behind.

In the immediate vicinity of the Geysers several large deposits of sulphur and quicksilver have been mined and ores shipped to San Francisco.

Near these sulphur banks we found the famous "Indian Springs," at which the great Edwin Forest camped for one season and was completely restored to health. Tradition informs us that our aborigines traveled to these springs from far and near, and bathed in the extensive mud or moor springs close by and drank the water, which they found possessed miraculous curative powers.

On analysis this water is found to yield:

"INDIAN SPRING"

LIGHT SALINO-SULPHUROUS WATER

PROF. THOMAS PRICE, Analyst, 1888

Temperature 108° F.

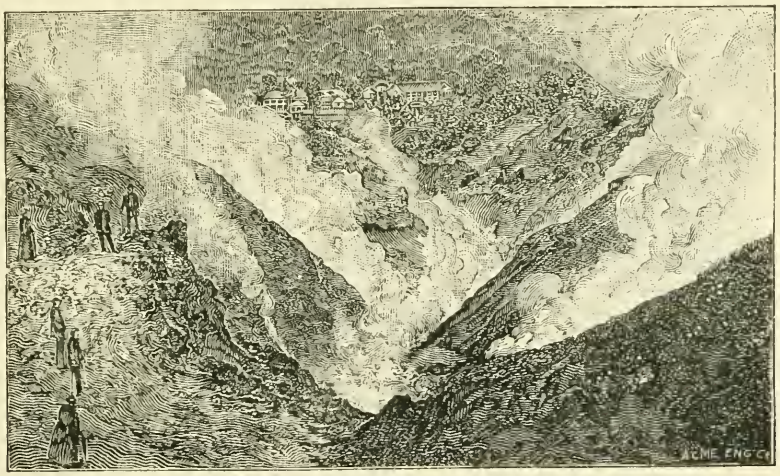
These mud baths will prove of great benefit in the treatment of chronic rheumatism, gout, arthritis and synovites, and scrofulous and cutaneous contaminations.



GEYSER CAÑON

As we drew nearer and nearer the sylvan resort our ears were greeted with sounds like those of a steamboat or locomotive—puff—puff—at regular intervals. These, we were told, and as we ascertained afterwards, came from the "steamboat" springs.

After a few more horseshoe curves have been passed, and several more of those magnificent landscapes have been mentally photographed on your brain, you reach the Geyser resort.

The many cozy cottages, the hotel and grounds, are situated in a leafy dell on the side of the mountain oppo-

site the Geyser cañon. The huge oaks and pines afford pleasant shade to the commodious verandas as you sit and enjoy the pure, dry, invigorating and exhilarating mountain atmosphere and picturesque scenery which surrounds you on every side.

Having indulged in one of those splendid sulphur Hammam baths, where the skin is rendered soft, white and pliable owing to the medicinal effects of the mineral ingredients, you are ready for dinner, and a good one it was during our visit to the Geysers in 1888.

The evenings are cool, clear and charming, insuring sound and refreshing sleep.

A TRIP THROUGH GEYSER CAÑON

Bright and early next morning we set out for our trip "over the river" to his majesty's Plutonian shores. In the Summer season the best time to start out is from 4:30 to 5:00 A. M., in order that you may perceive the full volume of the steam and sulphurous vapors as they rise several hundred feet into the air. Later in the morning the sun's rays condense the vapors so that they are not visible as far above the ground.

You are now armed with a long staff, like the pilgrims of old, and with your guide you set out to cross the Pluton River—this time on a bridge. Before doing so, however, your attention is called to a cool, clear spring, known as the "iron" spring. It is located near the edge of the Pluton River, on the same side as the hotel. This iron spring, on analysis, is found to contain valuable salino-chalybeate mineral ingredients.

"IRON SPRING"

LIGHT SALINO CHALYBEATE WATER

DR. WINSLOW ANDERSON, Analyst, 1888

Temperature, 72° F.

Mineral Ingredients	U. S. Gal. contains Grains	Mineral Ingredients	U. S. Gal. contains Grains
Sodium Sulphate	traces	Barium Salts	traces
Potassium Sulphate	traces	Alumina	0.23
Magnesium Sulphate	2.75	Silica	1.44
Calcium Sulphate	3.96	Organic Matter	traces
Ferrous Sulphate	0.19		

Total Solids, 8.57

Gases	Cubic inches
Free Carbonic Acid Gas	traces
Free Sulphureted Hydrogen	4.26

This water belongs to the light chalybeate class; its action is tonic, aperient and detergent, of value in anæmia, chlorosis and wasting diseases, torpidity of the bowels and liver, etc., producing constructive tissue metamorphosis.

Immediately after crossing the Pluton River, a change in the atmosphere becomes noticeable. On the side where the hotel and resort with the many picturesque and cozy cottages are built, the air is pure, dry and invigorating, on the side where Geyser Cañon is located, the atmosphere is mixed with the perfumes from the interior realm.

Near the path on the bank of the river, as you proceed up the cañon is situated quite a remarkable spring, containing large quantities of aluminium, sulphate magnesia and silicic acid. It is known as the "Alum Spring." Its waters are really alumino-ferrugino-sulphurous. On analysis it is found to contain:

"ALUM" SPRING

ALUMINO-FERRUGINO SULPHUROUS WATER

DR. WINSLOW ANDERSON, Analyst, 1888

Temperature, 98° F.

Mineral Ingredients	U. S. Gal. contains Grains	Mineral Ingredients	U. S. Gal. contains Grains
Sodium Chloride	traces	Manganesium Salts	traces
Sodium Carbonate	0.72	Barium Salts	traces
Sodium Sulphate	6.24	Aluminium Sulphate	57.62

Total Solids, 110.72

Gases	Cubic Inches
Free Sulphureted Hydrogen	6.35

This spring contains large quantities of ferruginous salts so essential in the treatment of malarial toxæmia and blood glandular diseases. The acid renders its action tonic and the magnesium gives it a pleasant laxative effect.

Following your guide, you soon realize that you are nearing the brink of eternity. You now cross the "Devil's," or Geyser, cañon and come to the "alum and sulphur" spring, having a temperature of 160° F. Proceeding farther on you next see the "black sulphur" springs, in which we find sulphide of iron. The ground is now getting warm under your feet, and the fumes from the "lower regions" make you think of the hereafter, and as you push on, a deep and steep ravine is entered, from which boiling hot steam and gases escape in every direction until you feel awestruck in this strange place! Passing along through the ravine, with the boiling water running at your feet, you enter "Proserpine's Grotto," in which is placed the "devil's arm-chair." This latter is a huge boulder which nature has hollowed out in the shape and form of a large parlor chair. In this you sit with great solemnity, to make sure of the benevolent friendship of his Satanic majesty.

The next point of interest is the "Devil's Kitchen," with warning signs of "danger" stuck up in every direction. The country rock is serpentine, sandstone and limestone, with igneous deposits and incrustations of sulphur, soda, cinnabar, etc., and as the fumaroles, cracks and fissures emit their boiling waters and vapors saturated with free sulphurous, sulphuric, hydrochloric acids and carbonic anhydride, all having strong disintegrating action on the formation, everything is, in consequence, soft and yielding. The banks and rocks are like clay and sand, easily dislodged upon the slightest touch—hence the signs of danger.

You are now fairly in the mouth of a boiling, seething, trembling and smoking Plutonian realm. The ground under your feet is becoming hotter and hotter, and the sulphurous fumes and vaporous steam are nearly suffo-

cating. Early in the morning these vapors rise to a height of three hundred to five hundred feet. It is also observed that these wonderful subterranean forces exhibit more activity at or near the full moon.

In this *olla podrida* of Hadean liquids are several interesting points and springs to be observed. Near at hand is a hot "Epsom salt" spring, having a temperature of 150° F., and over 140 grains of magnesium sulphate to the gallon of water. Another boiling spring of "iron and sulphur" has a temperature of 208° F. On the right side of the path is a large, black, sulphurous spring continually boiling and rumbling as the black, inky fluid reaches the bright dawn of day at a temperature of 162° F. It is the "Devil's Inkstand," a hot sulphurous iron and alum sulphide and sulphate water which makes very fair writing fluid. For this purpose it is used at the Geyser hotel, where the visitor inscribes his name on the register with his majesty's ink.

You next come to the "hot alum" spring, containing, as will be seen from the following analysis, over sixty grains of aluminium sulphate to the gallon. It is an alumino-ferruginous sulphurous water.

GEYSERS—"HOT ALUM SPRING"

ALUMINO-FERRUGINO-SULPHUROUS WATER

This spring water is an excellent hæmostatic in hemorrhages of the lungs, etc. It is also of service in dyspepsia and torpidity of the bowels and liver, its action being laxative, tonic and astringent, containing large quantities of sulphate of iron and aluminium, so valuable for medicinal purposes. (See therapeutical effects of mineral waters in preceding chapter.)

As you proceed along the not over "straight and narrow path," it is literally and practically important that you follow your guide and the "narrow path" here, lest one misstep hurl you into that "undiscovered country, from whose bourn no traveler returns." Innumerable springs and vents and subterranean outlets spurt and spout in every direction. "Pluto's Punch Bowl" is a large spring of hot lemonade, containing sulphuric acid and sulphates. The "Geyser Smokestack" is a large opening, from which issue volumes of sulphur-laden fumes, which rise into the air for several hundred feet, where it condenses and deposits again on the ground as water and sulphur, etc.

One of the most interesting springs in Geyser Cañon is the "Witch's Cauldron," a large, boiling, circular spring of over seven feet in diameter and of unfathomable depth. The water has a temperature of 212° F., and is unceasingly boiling and bubbling. The spring is a black, sulphurous fluid as black as the inky cloak of Hamlet. As the awe-struck tourists "round about the cauldron go" they see, in their imagination, the solemn ghost of Banquo rising and materializing in the fumes of the "charmed pot," and with a small stretch of the imagination you once more see the three witches and hear their husky voices chanting the solemn incantation—

"Round about the cauldron go;
In the poisoned entrails throw—
Toad, that under coldest stone
Days and nights has thirty-one.
Swelter'd venom, sleeping got,
Boil thou first i' the charmed pot!
Double, double, toil and trouble;
Fire burn and cauldron bubble.

" Fillet of a fenny snake
In the cauldron boil and bake ;
Eye of mewt, and toe of frog ;
Wool of bat, and tongue of dog ;
Adder's fork and blind worm's sting ;
Lizard's leg and owlet's wing,
For a charm of powerful trouble,
Like a hell-broth boil and bubble.
Double, double, toil and trouble ;
Fire burn and cauldron bubble."

On analysis this remarkable fumarole, having its source probably hundreds of feet below the surface, yields water rich in sodium, calcium and magnesium sulphates.

Free Sulphureted Hydrogen.....saturated

Next comes the "Devil's Canopy" and the "Geyser Safety-valve," an intermitting, scalding spring, which ejects streams of boiling water to the height of fifteen feet; then the "Devil's Pulpit," a little elevation where his Satanic Majesty (presumably) goes to direct the workings of his laboratory.

A little farther up and to the left are the wonderful "Steamboat Geysers," which can be heard a mile or more away, blowing and snorting intermittently at high pressure. This is seemingly a true geyser. The steam is so hot that it does not begin to condense until it is ten or fifteen feet from the surface. Tourists are very apt to burn their fingers trying to find out what makes the noise, as the steam is not visible. The temperature here is 214° F.

Around these hundreds of springs are incrusted deposits of crystallized sulphur, magnesium, alum, etc., etc. In many places one can stick his alpenstock into the sides of the banks, and immediately hot steam and vapors will issue.

You then pass on to the "Devil's Gristmill," where a large column of steam escapes from a hole in a rock with so much force that stones and sticks placed at the orifice are blown away like bits of paper. Loud subterranean noises are heard within resembling those of a gristmill, hence its name.

Going still farther up, the ravine is found to bifurcate. The left fork is still active, having dozens of springs, with temperatures ranging from 100° F. to 210° F. The right fork is cool and pleasant, with several pure water springs. Ascending at the bifurcation some one hundred and sixty feet you come to an elevation—a plateau of smooth, plastic clay stained with iron and sulphur. This clay has a temperature of 170° F. A long pole is introduced into the yielding clay and forthwith issue hot, smoking vapors. The edge of this plateau is called "Lover's Leap." Here the view of the boiling, seething, roaring, steaming, groaning and bubbling springs below is one of unrivaled grandeur. One hundred and sixty feet below you and all along the "Devil's" Cañon is one mass of smoking fury, shrill whistles, regularly intermitting puffs and groans, issuing from the interior of the earth. This sight alone is worth the whole trip.

To the eastward is "Lover's Retreat," a pleasant oasis in this wilderness of sulphurous clouds. Here also is the "Temperance Spring,"—of clear cold water. Near it is a large fallen oak, which serves at once for a seat, and a knot hole in one of its huge branches is known as the "Post-office." Here we leave our cards in case civilization is never reached again.

Going along the usual route, we pass over the "Fire Mountain" with its hundreds of small orifices through which miniature geysers issue. The temperature of this ocherous clay is 175°F. A little east of this is located "Alkali Lake" and the "Lava Beds." Here the crust is so thin that stamping hard on it produces a hollow sound. This is evidently an extinct volcanic crater on a small scale. We now pass the "Indian sweat bath" and come to another remarkable spring known as the "Devil's Tea Kettle." This is one of the strongest vapor springs on the coast. The orifice is three feet in diameter, opening out of the side of the mountain with a huge boulder overhanging it. The "Tea Kettle" spring is about half a mile from the active springs in Geyser cañon. The vapor is emitted with such force that a large bunch of brush placed in front of it is instantly swept away for many feet. This steam is above the boiling point and is sulphurous in character, and contains a large quantity of free sulphuric acid. Formerly a huge cone with a steam whistle attached to it was constructed over the orifice, but it made such a noise as to keep the guests awake at night, and was therefore taken down.

GEYSERS—"DEVIL'S TEA KETTLE"

SALINO-ALUMINO-SULPHUROUS

Your route now lies along the side of a mountain where a narrow path has been cut out of solid igneous rock. Below you is the Pluton River, and above you the snorting geysers. Issuing from the side of the solid glass mountain are two remarkable springs—the "Hot Acid" and the "Lemonade," whose waters are rich in the potassium salts so valuable in many conditions and diseases. The acid spring is remarkable for the fact of its having 154 grains of free sulphuric acid to the gallon, and the lemonade spring from the fact that it is one of the few springs in California which has free muriatic acid.

Analyzing these waters they are found to contain:

GEYSER SPRINGS

ACID WATERS

Prof. Thomas Price, Analyst, 1888

	LEMONADE SPRING *Temperature, 103° F.*	HOT ACID SPRING *Temperature, 136° F.*

These waters are among the finest in the State for dyssepsia, torpidity of the liver and bowels, malaria, anæmia, and many blood, glandular and cutaneous affections.

They are pleasantly sour, and with sugar or syrup, make one of the nicest of lemonades.

The next place of interest is the "Devil's Oven," a large excavation in this silicon oxide mountain where in years gone by this igneous rock was at a white heat. All over this realm of subterranean outlets the crust of the earth is covered with the products of the Plutonean shores—sulphur, iron, magnesia, nitre, alum, etc., etc. On again reaching Pluton River, several more cold and hot springs are seen. Some are sulphureted and others are ferruginous, magnesic and aluminic.

Several hundred feet up the Pluton River has been constructed a large and commodious bathing establishment, which spans the river. Every facility for bathing has been arranged. The hot sulphurous vapor issues directly through the side of the mountain, and gains admission into suitable apartments where the bather can enjoy the medicinal effects of the sulphurous fumes and steam vapors at any desired temperature. Then there is the plunge and individual tubs and sweating chambers, and comfortable dressing-rooms. One half of the bathing facilities are for ladies and the other half for gentlemen.

This bathing fluid is remarkable on account of the large amount of borates it holds in solution.

One gallon contains as follows:

GEYSERS—BATHING WATER

LIGHT SALINO-BORIC-SULPHUROUS WATER

DR. WINSLOW ANDERSON, Analyst, 1888

Temperature 137° F.

This is one of the best bathing waters on the coast. The borates and sulphates render the skin soft, white and pliable, cleansing the 7,000,000 little pores on the cutaneous surface of an average-sized man. (See article on bathing in front part of book.) This water has proved highly beneficial in the treatment of the many cutaneous, syphilitic and strumous contaminations, rheumatism and chronic joint troubles, white swellings (synovites), gout and articular diseases.

The water is also used for internal administration. Its action is laxative, diuretic and diaphoretic, effecting chylopoietic and intestinal tracts as well as the kidney and skin.

A large swimming pond has been constructed by damming the Pluton River. The water has a temperature of 75° F., and is a combination of all the mineral spring waters.

The Geyser Springs, hot and cold, flow daily about 100,000 gallons. The area covered is about four hundred acres. Most of the activity, however, is confined to the "Devil's" or Geyser Cañon, and comprises about sixty acres.

Many of the springs resemble *true* geysers, such as we have in the "wonderland of America"—Yellowstone Park—and in Iceland; but scientific authorities classify our California geysers as fumaroles or openings and outlets in a volcanic district.

From the following analyses, made by Prof. Price and the writer, it will be observed that at the Geysers can be found perhaps a greater variety of mineral waters than at any other place on the continent, or perhaps in the world. The waters are valuable for the many conditions noted under the head of "Therapeutics of Mineral Waters" in a preceding chapter, and they cannot fail to attract attention. Extensive Indian mud baths are found near the edge of the river, between the hotel and the sulphur banks.

They are sulphurous and ferruginous, and of great therapeutic value as soon as suitable bathing facilities shall have been constructed.

As the first visitors at this California Hecla were at a loss for motive power to produce all these boiling, steaming and spouting Stygian sluices, they naturally turned to their early teachings for a solution of the phenomena. As they were all good people and had early been taught the power of his Satanic Majesty located—well he used to reside in the infernal regions, presumably in the center of the earth—why they most naturally gave him the credit and named the springs with their present euphonious names of "Devil's" this and "Devil's" that, a process of reasoning that has been applied to names given at a more recent date. In order to be true to nature we have described the springs with their names as we found them.

The owners of these valuable springs and health resort contemplate making extensive improvements in the near future. New hotels and cottages will be erected, new and complete bathing facilities will be constructed, and the springs will be placed in the hands of a competent, graduated physician, who will study the therapeutical effects of the different springs and administer the waters and prescribe the baths intelligently.

The Geysers are wonderful and picturesque exhibitions of the nearly extinct volcanic forces slumbering beneath the romantic "Devil's Cañon," and the resort is one of the pleasantest and most salubrious watering places we find on the coast, and destined to become one of the world's greatest sanitariums.

LITTLE GEYSERS

About four miles farther up the cañon we find the "Little Geysers." These are small sulphurous, steaming springs of no special importance.

69. OTHER GEYSERS

Near the mouth of Willow and Warner Creeks, in Plumas County, are found a number of small geyser springs. The temperature is near the boiling point, and sulphurous steam and vapors rise from twenty to fifty feet into the air. The property is unimproved.

70. GEYSER SPRINGS

Near Geyser's Station, in Sonoma County, are located several hot and cold springs. There is a growing resort established there. The waters are alkaline, and range in temperature from 55° F. to 212° F. Collectively the springs flow about 1,000 gallons per hour. The water is also used commercially.

71. GEYSERS IN LONG VALLEY

At the extreme western end of Long Valley lie a few spouting hot springs. They are on the south branch of Owen's River in Mono County. The property is unimproved at present.

72. GEYSER SPA OR SODA SPRINGS

These springs are located near Litton's Station in Sonoma County, some four miles from Geyserville. There is a pleasant resort on the grounds. The surrounding country is picturesque. The climate is mild and salubrious, and many people go to Geyser Spa every year. The

waters are highly esteemed for their antacid, diuretic and aperient properties. The following analyses are made by Bauer or Price, I am not certain which, and the author shows that the water belongs to the light alkaline class:

73. GILROY HOT SPRINGS

The Gilroy Hot Springs are located on the Coyote River, about nine miles northeast of the town of Gilroy, in the Santa Clara Mountains. They are reached by the Southern Pacific Railroad to Gilroy, and from thence by easy stage over a good mountainous road with picturesque surroundings. Nestled in among the mountains like a fortress of old lie the Gilroy Springs. The delicious atmosphere, rich in ozone, is daily brought from the fragrant spruce and pine forests by the gentle zephyrs, to insure health and vigor to all who breathe it.

Gilroy has one main spring which flows in great abundance. The temperature varies from 108° F. to 115° F.

This is a light alkalo-sulphurous water, and is used with considerable benefit in syphilis, rheumatism, scrofula and glandular swellings, chronic skin eruptions, etc., etc. It is taken internally in four to eight ounce doses and acts kindly on the liver and bowels. The water is also used for bathing, for which excellent facilities have been constructed.

Near this hot sulphur spring are two cold sulphur springs flowing very much less. Some six miles along the mountain side is a delicious soda spring free from sulphur and highly carbonated.

The hotel is large and commodious. Every appointment is complete, and guests are well cared for. There are several handsome cottages on the sunny slope of the mountain for private and family use.

Hot sulphurous mud baths have recently been added, which are much used by the rheumatic, gouty, syphilitic and strumous, and those having joint troubles.

GILMORE'S GLEN ALPINE MINERAL SPRINGS AND HEALTH RESORT

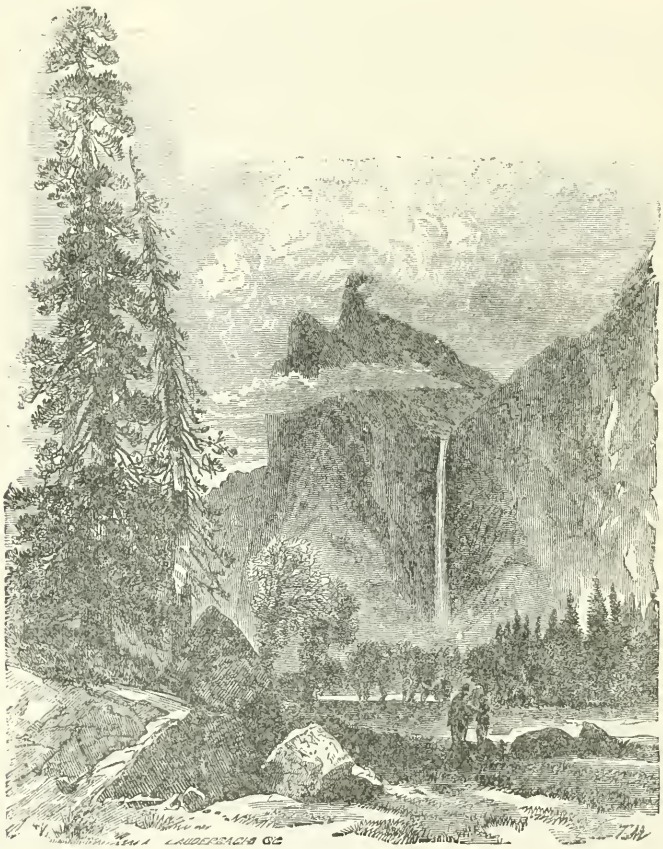
Back in the mountain fastnesses, at a distance of seven miles from Lake Tahoe and with an elevation of 6,700 feet, are the Gilmore Glen Alpine Mineral Springs.

The wild, rugged gorge in which they are situated runs back from Tahoe a distance of some ten miles, filled throughout its entire length with varied scenes of beauty and grandeur, and terminating abruptly in a glacial amphitheater. The mighty glacier which originated here went grinding, crushing and cutting its way down, forming the beds in which now lie the beautiful lakes, in a chain of which Tahoe is the last link. The old glacier has written its record deep in the granite faces of the majestic mountains, which looked down in silence upon that work of the terrific forces of nature still revealed in the masses of giant boulders piled upon their sides, and in the scratched or polished surfaces of stone in the bed of the cañon below.

But there is no suggestion of the chaos and desolation of those days of their birth in the tranquil bosoms of the lakes, which now slumber or awake and sparkle in the depths of the cañon, where thick groves of pine, tamarack, spruce and silver fir cast deep, cool shadows. The region is rich in exquisite flowers and ferns.

SUSIE LAKE—Gilmore's "Glen Alpine"

These dimpling lakes, with the wild beauty of their surroundings, are sufficient to enthral the heart of him who visits them, but if he be devoted to the rod and reel he will find an additional charm in the swarms of speckled beauties which sport in the clear depths and rise to his glancing fly.



YOSEMITE SCENE

First in the chain of lakes is the Half-Moon, which lies with Lake Alta Morris in the amphitheater at the head of the cañon. Their outlet tumbles down its rocky bed into Lake Susie, a mile below, a picturesque, romantic spot. Near by is Heather Lake, which needs a Scott to sing its beauties. Quantities of heather hand their dainty bells, white, pink and purple, around its pebbly shores, and the

GLEN ALPINE FALLS

snowbanks lie very near. The stream continues from Lake Susie, making an abrupt leap at first, which forms the beautiful Glen Alpine Falls; then babbling on to feed Lake '84, less than a mile below.

Leaving that lake the bright stream dashes on, passing the Glen Alpine Springs, from which point it can be watched, as one drives down, making its way to another haunt of the trout. There it "glides under lily-pads" into a lake named Lily, from the abundance of its water-lilies.

Fallen Leaf Lake, the gem of the Sierras, is just a mile below Lily, and separated from Tahoe by a level strip one mile in width. The drive from Tahoe to the head of Fallen Leaf, winding around its shores, is very beautiful. The early morning reflection here is perfectly enchanting.

This region has been opened to the public with great labor and expense by the construction of a wagon road as far as Glen Alpine Springs, and mountain trails to all the lakes, including a trail for the ascent of Mt. Tallac, which rears its head 10,000 feet above the sea and commands a wide and magnificent view of the distant peaks and numerous lakes.

The lakes have been furnished with boats and stocked with the finest trout, and black bass have been added, making the Glen Alpine fly fishery one of the finest, nor do the finny tribes scorn a baited hook. Saddle horses are kept for use on any of the trails.

Accommodations for guests have been prepared at Glen Alpine Springs, where those in search of health or pleasure may remain almost with a certainty of gaining both. The air possesses the quality of purity and balminess in perfection, and the granite walls surrounding the Glen radiate in the evening the heat which they absorb during the day, making the evening air soft and dry; and frost is rarely seen from the first of June until the first of September.

GILMORE'S GLEN ALPINE SPRINGS

CARBONATED AND CHALYBEATE

DR. WINSLOW ANDERSON, Analyst, 1888

Temperature, 39.6 F.

The water is pleasant to the taste and highly charged with carbonic acid gas. Its action is gently aperient and diuretic, useful in dypepsia, torpidity of the bowels and kidney and bladder irritation. It is also tonic and of value where iron is indicated.

75. GORDON'S MINERAL SPRINGS

About half way between Calistoga and Lakeport, in Cobb's Valley, Lake County, lie Gordon's Springs. They are romantically situated in the heart of a mountain and forest region. The climate, too, is beautiful. Invalids pronounce it mild and balmy. During Summer months the temperature ranges from 72° to 90° F.

The springs are at an elevation of about 3,000 feet. The principal spring flows about three hundred gallons per hour, having a temperature of 100° F. The waters are sparkling alkaline, having antacid and aperient properties. For chronic albumenurea and cystitis these springs have a high reputation. In acid dyspepsia the water is recommended before meals.

A pleasant resort has been established in this mountainous region, and it is worthy of remark that persons suffering with chronic bronchitis, catarrh, asthma, and early stages of consumption, do well at this altitude among the pines.

The circling hills that guard Clear Lake like lazy giants lie
Beneath the ardent sunshine, their faces to the sky;
Konocti sees across her waves Night's elfin shadows play,
And loves to catch and fling to her the first red lights of Day.

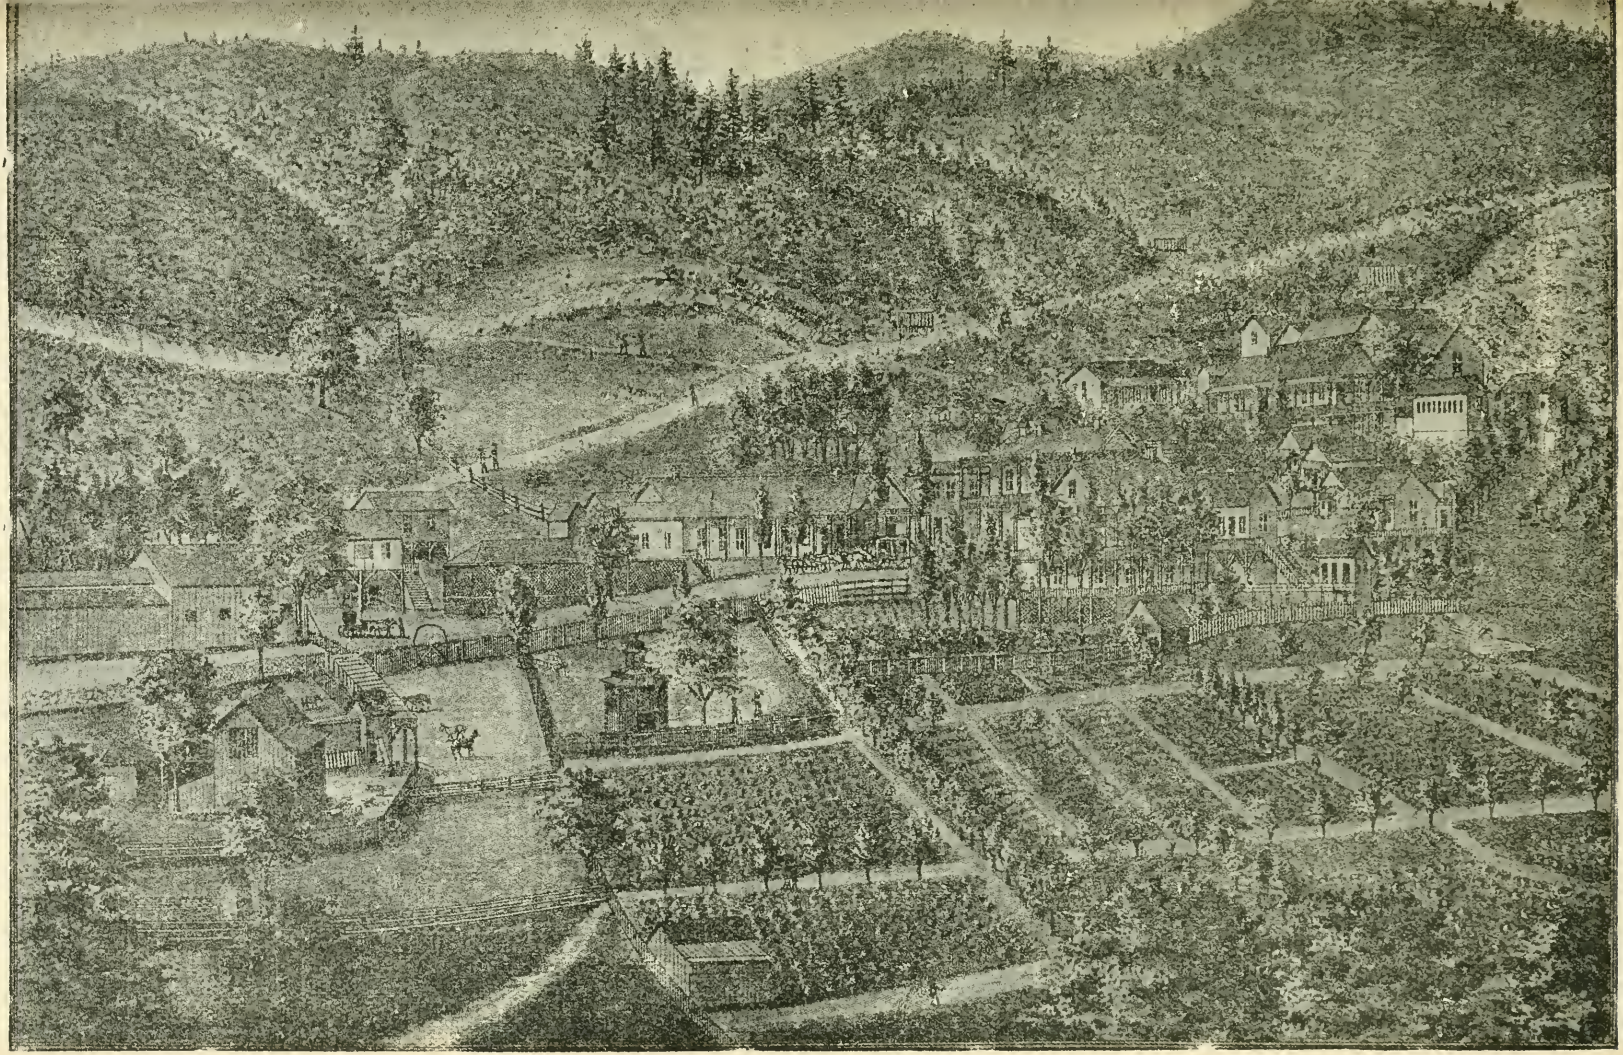
Back from the lake the pretty town goes dancing to the hills
That greet her with a gift of flowers and serenade of rills.
The wine of life is in the air that wafts the fragrance down
From resinous pines and odorous flowers to lake and shore and town.

Oh! fairest land beneath the sun, within whose border lies
The glory of an emerald earth o'erhung by sapphire skies,
And where, like threads of finest gold, the yellow sun-rays fall—
Where Beauty makes her dwelling-place, and Heaven is over all.

—*Carrie Stevens Walter.*

HARBIN HOT SULPHUROUS AND MINERAL SPRINGS

At an elevation of about 1,700 feet above tide-water, and at the base of a spur of the Coast Range of mountains, in Lake County, about twenty miles from Calistoga, are located these excellent springs and resort. It would be difficult to find a more delightful or picturesque spot so rich in scenery, mountains perpetually clad in evergreen garments and hills with verdure bright forming the background of the landscape. Then we have brooks and rills, now smoothly gliding over moss-covered banks and now trickling down silvered paths with pebbles bright, forming miniature cascades in their ever restless pace to join the broad Pacific.



HARBIN SPRINGS

The climate, too, is one of the most salubrious in the State, having a mean thermometric degree of about 70° F. Although the climate and surroundings are exceedingly favorable to the healthfulness and pleasure of visitors and invalids, the great virtue of Harbin lies in the intrinsic therapeutic value of the mineral springs.

The waters are sulphurous and saline, the principal spring flowing 1,500 gallons per hour. There is also a smaller chalybeate spring fount, yielding only sixty gallons per hour.

The Sulphur Spring has a temperature of 122° F. For this hot water excellent bathing facilities have been constructed, and much benefit accrues in the treatment of chronic rheumatism, gout, joint diseases and cutaneous affections by prolonged or frequent bathing in this water.

For internal administration the sulphur water, as well as the ferruginous waters, are used. In torpidity of the chylo-poietic and intestinal tissues, dyspepsia, kidney troubles, etc., and especially in glandular and skin diseases, on account of the arsenic present, the Harbin mineral waters have proven of great value.

HARBIN HOT SULPHUR SPRING

The salino-carbonated water, or soda, is a very pleasant and palatable table water. It is very gently laxative, and tonic. An excellent water for the dyspepsia superinduced by a too familiar friendship with Bacchus. It is good in morning vomiting and irritative indigestion. For Bright's disease and irritation of the kidneys and bladder, with acidity of the urine, it is highly recommended.

The "arsenic" spring presents an excellent combination for blood-glandular disorders, cutaneous diseases, scrofula, gout and rheumatism. The potassium salts, iron and arsenic are valuable medicinal agents. It has carbonic anhydride enough to make it palatable. Its action is tonic and alterative, laxative and diuretic.

In syphilitic and skin diseases, goitre, swollen glands, etc., this water has become quite famous.

HARBIN SPRINGS—"ARSENIC" SPRING

At Harbin Springs we find first-class accommodations, a good table, fine fishing and hunting, with the excellent climatic advantages common throughout Lake County.

77. HATCHIN HAMA SPRINGS

This is a salino-alkalo lake fed by a number of springs. It was found four miles west of Borax Lake, southeast of Clear Lake, in Lake County.

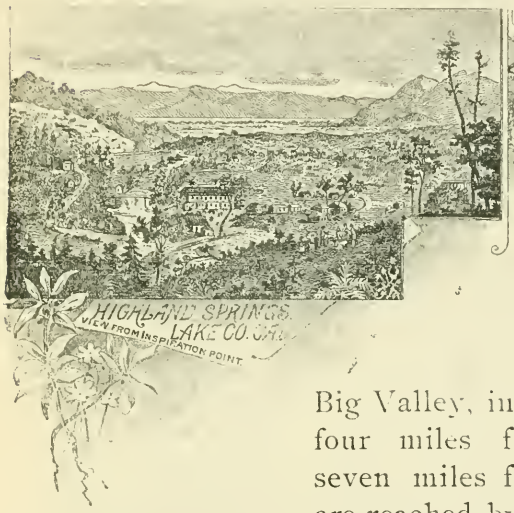
78. HENSLEY'S SPRINGS

These are found in Tehama County, and are strongly impregnated with iron. They are much used locally.

79. HIBB'S SODA SPRINGS

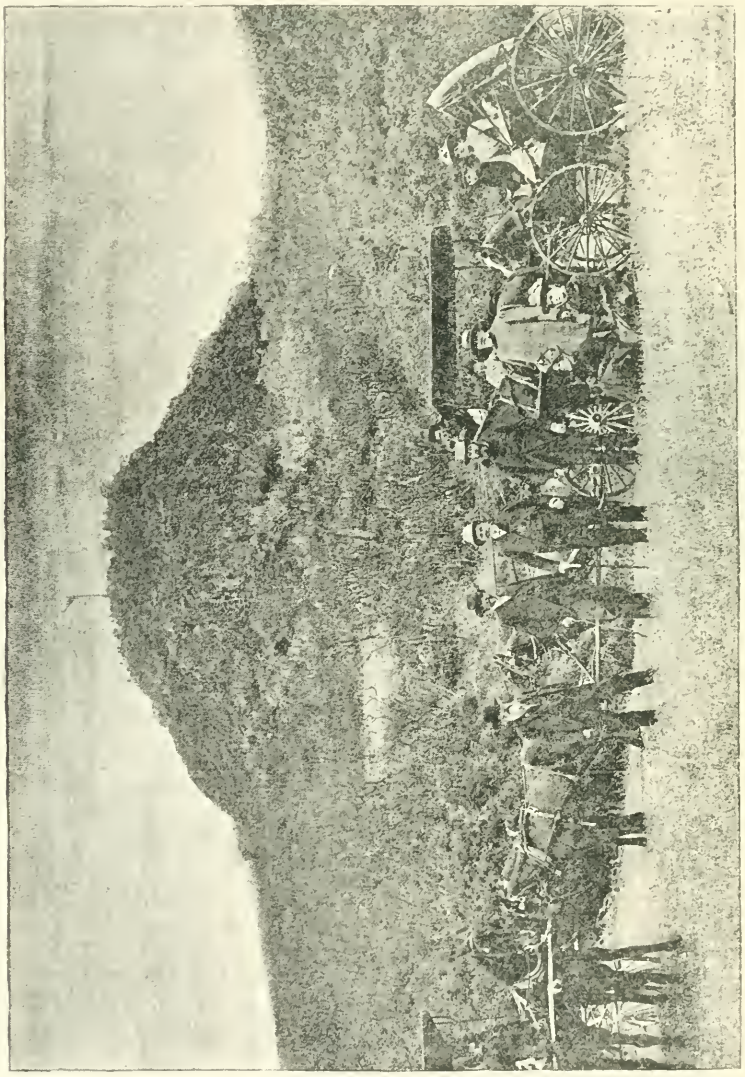
These mineral springs are found sixty-two miles north of Redding, in Shasta County. They are reported as pleasant, sparkling soda waters, gently diuretic and aperient, and of value in kidney and bladder troubles. The waters are used for miles around.

80. HIGHLAND SPRINGS



These excellent springs are located within the edge of the mountains from Big Valley, in Lake County, about four miles from Kelseyville and seven miles from Lakeport. They are reached by the Southern Pacific Railroad on the south to Calistoga, and thence by stage, by the Northern Pacific ("Donohue Road") on the southwest to Cloverdale, and thence by stage; by stage from Mendocino County on the north and Colusa County from the east. The drive by stage from Calistoga or Cloverdale to the springs is exceedingly picturesque. Every turn presents something new and interesting. Here and there are seen the mountains thickly covered with woods. Here and there are moss-covered banks and running brooks over which hang huge ferns and shrubbery. Now we are on the narrow road on the mountain side, several hundred feet above the river, and an almost precipitous descent over the banks. With a short turn we sweep around the curve in the road, and the dexterity with which

the trained stage driver wheels his six-in-hand around these cuts and curves is something marvelous. At length the summit is gained. This is an elevation of 3,200 feet above



HIGHLAND SPRINGS

the sea level. Here one sees one of the grandest sights imaginable. As far as the eye can reach in every direction are mountains and valleys, peaks upon peaks, moun-

tain streams and brooks, forest and shrubbery. The most picturesque of all is the view northward over Clear Lake and Lake County. The lake itself, a magnificent sheet of water, is twenty-five miles long and six to eight miles wide. It has an altitude of 1,200 feet, and lies peacefully smiling in the embrace of the mountains on all sides, with "Uncle Sam's" head above them all. We see the bright cultivated fields like a huge checkerboard in the valley below. The gigantic oaks—the largest in the State—are scattered here and there to complete the kaleidoscopic panorama. Well might this be called the "Switzerland of America," for a more magnificent picture can scarcely be imagined. The descent to the springs is made in much less than half the time that it takes to make the ascent, and the springs are soon seen lying in a level sequestered spot surrounded by hills, and by trees of many years' growth.

At Highland's we find a commodious hotel and many elegant cottages built with a view to health and beauty combined. There is also a livery stable at which saddle horses and carriages may be procured for the drives to Lakeport, Soda Bay, Kelseyville, etc. A large pure mountain stream runs past the hotel, which is well supplied with fish. The climate is mild and dry, and the air is pure and filled with ozone and scents from the fragrant woods and plants which abound on the grounds. The altitude is about 1,700 feet, and it is claimed to be an excellent place for consumptives.

Mineral springs are usually abundant in Lake County, and some of them are of considerable therapeutic value. At Highland's there are some twenty springs, all of which I examined in 1888. Five of the most important are subjected to careful analyses.

THE SELTZER SPRING

This valuable spring is situated about five hundred yards from the hotel, eastward. It is conveniently cemented

and covered with a summer-house. The waters are alkalo-saline and chalybeate, and very efficacious in many diseases requiring antacid, laxative, diuretic and tonic properties. It has been used with much success in dyspepsia, neuralgia, kidney and bladder troubles, calculi, etc., and rheumatism, gout and skin diseases. This spring has changed but little in six years, as seen by the following analyses:

HIGHLAND SELTZER

ALKALO-SALINE AND CHALYBEATE

The "Dutch or Ems," "Neptune," "Diana" and "Magic" are located on a small bank across the little stream. The distance from the hotel westward is from one hundred to two hundred yards. The springs are all nicely cemented with artificial stone. They are kept clean and inviting. In most cases suitable houses or coverings have been constructed.

The Dutch or Ems Spring is more diuretic and laxative than the Seltzer. It has a larger amount of iron and less strongly carbonated. But little change is observable in six years.

In this analysis of Neptune Spring will be observed quite a change, especially in the calcium salts. Many of these cold carbonated or superficial springs are known to change from year to year, depending largely on the rainfall, etc.

HIGHLAND

Besides the springs herewith mentioned, there are several others on the premises not fully developed. Their names are: "Lime Kiln," "Ladies' Delight," "Small Diana," Nos. "1," "2," "3," "4," "5," "Minna," and others. On looking over partial analyses made by Mr. O'Neil, of the University of California, I find their composition is very similar to those already analyzed.

Highland Springs health resort, with its picturesque surroundings and excellent climatic advantages, bids fair to become one of our most popular watering places in the State.

HOT BORAX SPRING

This spring is remarkable on account of its large value, the excessive amount of ammonium salts and the large quantity of borax present in the water. Prof. Whitney speaks of the changeableness of this spring, both in its flow and in its ingredients.

The water is used in Lakeport and surrounding country for inflammation of the kidneys and bladder. It is also claimed to have dissolved a stone in the bladder.

HOT MUD SPRINGS

Extensive hot mud beds and springs are found on the banks of Shovel Creek, in Siskiyou County. The locality is filled with sulphurous fumes and mud, and incrustations of native sulphur deposits on the cooler margins of the springs.

A small resort has sprung up at this place, and chronic rheumatic and crippled invalids are said to improve while bathing in the mud.

HOT SPRINGS

Thermal springs—sulphurous, calcic, saline and alkaline—abound all over the State. Many have not been even named as yet.

The following list comprises a number of the undeveloped hot springs in California:

HOT SODA SPRINGS

Near the head of Battle Creek, in Plumas County, are located several hot soda springs. They flow a large volume and the waters have a high temperature. No improvements.

HOT SPRINGS—ON PAOHA ISLAND IN MONO LAKE

Total Solids (37 grains to gallon) 0.2945

This spring has a temperature of 110° F., and is in the middle of Mono Lake, which contains 3,000 grains of salt to the gallon, while this water has only 37.88 to the gallon.

HOT SPRINGS NOT NAMED

Three miles east of Canby, in Modoc County, sulphurous.

In Modoc County, on the east side of Middle Alkali Lake, seven miles southeast of Cedarville.

Southeast of Lassen's Peak, in Plumas County, at the head of Warner's Creek.

At the base of Warner's range in Modoc County, at the south end of Lower Alkali Lake.

In Santa Barbara County, five miles south of the city of Santa Barbara, are several hot springs having a temperature of 112° F. to 118° F. The water is sulphureted, and a resort is being built.

West Side of Lower Alkali Lake in Modoc County.

Between Upper and Lower Alkali Lakes, in Modoc County.

In Mono County, thirteen miles west of Bridgeport.

In Plumas County are several more springs. Some are sulphureted, others are alkaline.

In northwest part of San Diego County, at the bend of San Jacinto River.

In Kern County, near Kern River, seven miles below Kernville. These waters are highly charged with sulphureted hydrogen. Temperature 127° F.

Near Big Valley, in Lassen County, between Clear Creek and Pitt River are several springs—mostly sulphureted.

In Los Angeles County, about twelve miles northwest of San Juan Capistrano, are six alkalo-sulphurous springs. The temperature varies from 123° F. to 130° F.

Near the summit of Mt. Shasta are several hot alkaline springs.

In Ventura County, south of Rafael Peak. One of the many springs has a temperature of 195° F.

In Mono County, two miles southeast of Bridgeport.

Near Benton, in Mono County. Hot saline. Temperature 138° F.

In Kern County, seven miles southeast of Kernville and five miles northwest of Havilah.

In Long Valley, Mono County, five miles east of the Geysers. Temperature 140° F.

In Inyo County, west of Dry Salt Lake, on the Armagosa Creek.

On the east side of Hot Cove, on the Paoha Island, in Mono Lake, Mono County. Temperature 110° F.

In Amador County, in a small valley west of Markleeville.

West of Panamint, six miles, in Inyo County.

In Colusa County, four miles south of Bear Valley. Temperature 120° F. Saline.

In Inyo County, on both east and west side of Owen's River, in the valley south of Bishop's Creek. Temperature 132° F.

In Plumas County, south of Lake Cañon, near the head of Battle Creek. The waters are alkaline. Temperature 85° F.

In Modoc County, two miles north of Fort Bidwell.

In Surprise Valley, Modoc County, east side of Middle Alkali Lake and opposite Cedarville. Several springs have a temperature of 180° F., and are sulphurous.

HOT SODA SPRINGS

Located in Plumas County, on Battle Creek. Temperature 196° to 200° F. A large volume of hot alkaline water issues from the springs. The property is not improved.

HOUGH'S MINERAL SPRINGS

These springs are pleasantly located in Lake County, on the north fork of Cache Creek, about thirty-two miles from Williams. The altitude is 1,960 feet.

Route of travel: Take ferry and railroad from San Francisco to Williams, or via Calistoga, and thence by stage. The waters are all cold, having a temperature of about 60° F.

No. 1, the main spring, contains magnesia, soda, silica, alumina and ferruginous salts, with an excess of carbonic acid gas. The water is tonic, aperient and diuretic.

No. 2 flows from an artificial well dug about twenty-five feet deep. It contains a stronger impregnation of iron and more magnesia salts, producing free evacuations after each large draught.

No. 3, also a well, twenty-eight feet deep, contains some sulphur, and is much used for cutaneous and rheumatic diseases.

No. 4 is a carbonated water. The resort is a pleasant one, and gaining in public favor every year.

HOWARD SPRINGS

The Howard Springs, some fourteen in all, are located in Lake County, six miles from Lower Lake and thirty-two miles from Calistoga. They lie in a small basin, at an elevation of 2,220 feet, surrounded on all sides by hills covered with luxuriant vegetation, flowers and sweet woods. The resort is growing every year, and ample accommodations are found for invalids and pleasure-seekers. Hunting

and fishing, the "California diamond fields," pine forests and good tonic alkalo-carbonated waters are among the attractions found at Howard Springs.

The springs consist principally of sparkling carbonated waters. Two or three also contain sulphur. These are used for bathing.

The carbonated waters contain sodium chloride, sodium bicarbonate, magnesia and calcium salts, with small quantities of potassa, silica, iron and alumina, and are heavily charged with carbonic acid gas. The springs are very useful for many conditions requiring this class of medication.

INFLAMMABLE NATURAL GAS

In many places all up and down the coast this product is found, and we are glad to see that it has already been utilized for heating and illuminating purposes. The gas is capable of lighting and heating many of the health resorts near which it is found.

One of the most remarkable of these natural inflammable gas springs is found at Byron hot springs (see Byron Springs).

Another at Kelseyville, the property of Mr. Young, and described under the head of "Young's Gas Well."

On the south side of Sulphur Creek, three hundred yards back from the original Wilbur springs, in Colusa County, is located a large natural gas spring, which has been burning for years. The flame reaches up about two feet from the ground, a foot or more in diameter, and burns with a pale-blue flame and yellow tips.

Near Upper Lake, in Lake County, is another gas spring, yielding large quantities of natural gas.

Valuable natural gas is found in Colusa, Los Angeles, Monterey, San Joaquin, San Mateo, Santa Barbara and other counties.

An extensive utilization of natural gas is being made at the Crown Mills, in the San Joaquin County. The main gas well is 1,330 feet deep and yields 15,000 cubic feet of gas in twenty-four hours. The gas is now used for heating the boilers in the mill, being burned with a small quantity of coal for that purpose. It has also been used for illuminating the mill, and a great saving in fuel and light is reported.

The most productive gas well is found near the southwestern edge of the city of Stockton. The well has a depth of over 2,000 feet and produces from 70,000 to 80,000 cubic feet of gas in twenty-four hours. As the gas issues from the well it burns with a slight empyreumatic odor, undoubtedly owing to the imperfect combustion of its carbon. When burned in a lamp—the "Lundgallon," specially constructed for the purpose—complete oxidation occurs and a good light is produced. On analysis this gas is found to contain:

Hydrogen (CH_4), marsh gas, the light carburetted, 83 per cent., and small quantities of hydrogen, oxygen, carbonic acid gas and carbonic oxide gas.

The owners purpose laying pipes into the city of Stockton in order to supply it with heat and light from nature's laboratory at greatly reduced rates.

IODINE SPRINGS

These remarkable springs are located in Grizzly Cañon, Lake County. The iodine is found in combination with sodium, potassium and magnesium in considerable quantities. The inhabitants in the neighborhood speak highly of the springs, and the water is used for miles around for consumption, glandular swellings, skin diseases, etc. The springs are in a wild, picturesque cañon, and are unimproved. These iodine springs were analyzed by Hanks and Falkenan several years ago and pronounced remarkable on account of the large amount of iodine present.

Iodine, with sodium, potassium and manganese, has been found in several parts of the State, as will be seen by the analyses.

IRON SPRINGS

Several unnamed ferruginous springs are located in Tehama County, some two miles north of Tom's Head Mountain. The waters are said to be strongly charged with iron salts and carbonic acid gas, as seen from the incrustations around the springs.

Another iron spring is located near the Huero-Huero Rancho. No analysis.

KLAMATH HOT SPRINGS

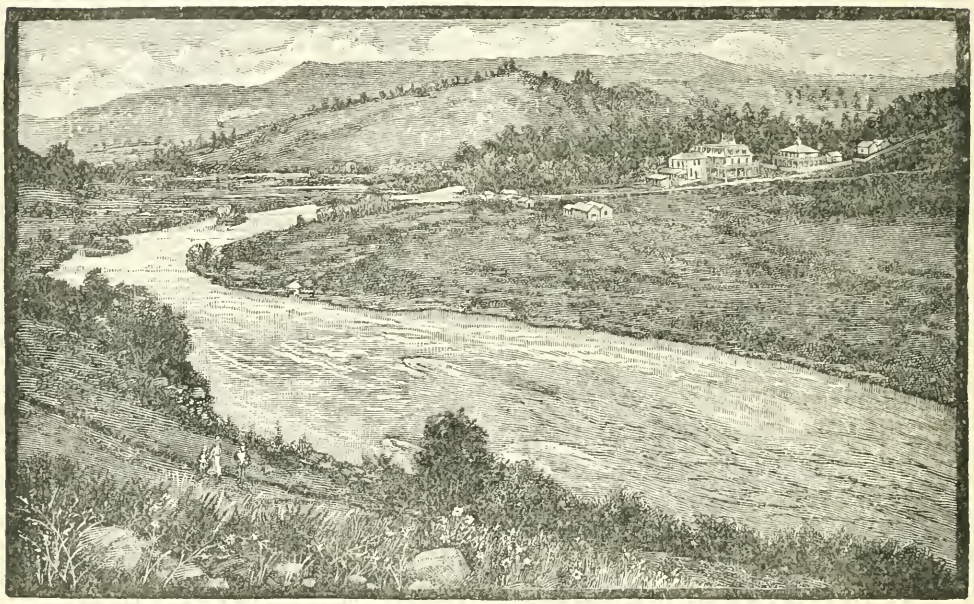
In the northern county of California, Siskiyou, some eighteen miles from Ager, and on the Shasta Division of the Southern Pacific Railroad, are located these famous springs and the sanitarium. Situated as they are in the wild and picturesque country of Mt. Shasta region, 2,700 feet above sea level, with snow-capped mountain peaks and hills clad in evergreen forest groves, the springs have become noted for the surrounding scenery as well as for the therapeutic properties of the mineral waters.

At Klamath we find ample accommodations for invalids and guests.

Excellent bathing facilities have been added, so that hot or cold sulphurous baths or hot steam baths may be had at the springs.

Gunning and fishing may be had in abundance in the immediate vicinity.

The waters are alkalo-saline and sulphurous. Some are carbonated, but most are sulphureted. The springs



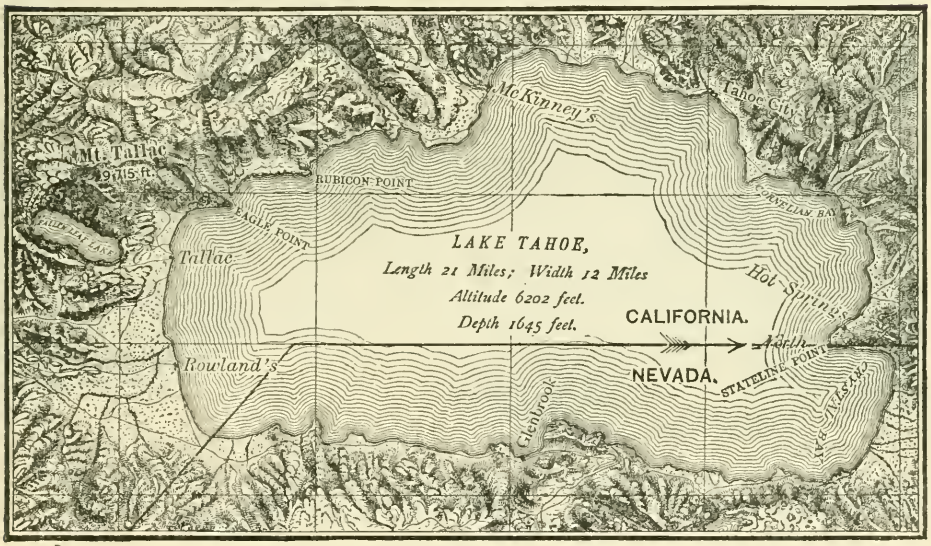
KLAMATH HOT SPRINGS

have already gained considerable celebrity in the treatment of chronic rheumatism, gout, white swelling of the joints, glandular enlargements, and chronic cutaneous diseases. The saline and carbonated waters are used for liver and kidney troubles, dyspepsia, etc., and the sulphur waters and sulphurous water or steam baths for rheumatism and skin affections.

LAKE TAHOE OR CARNELIAN HOT SPRINGS

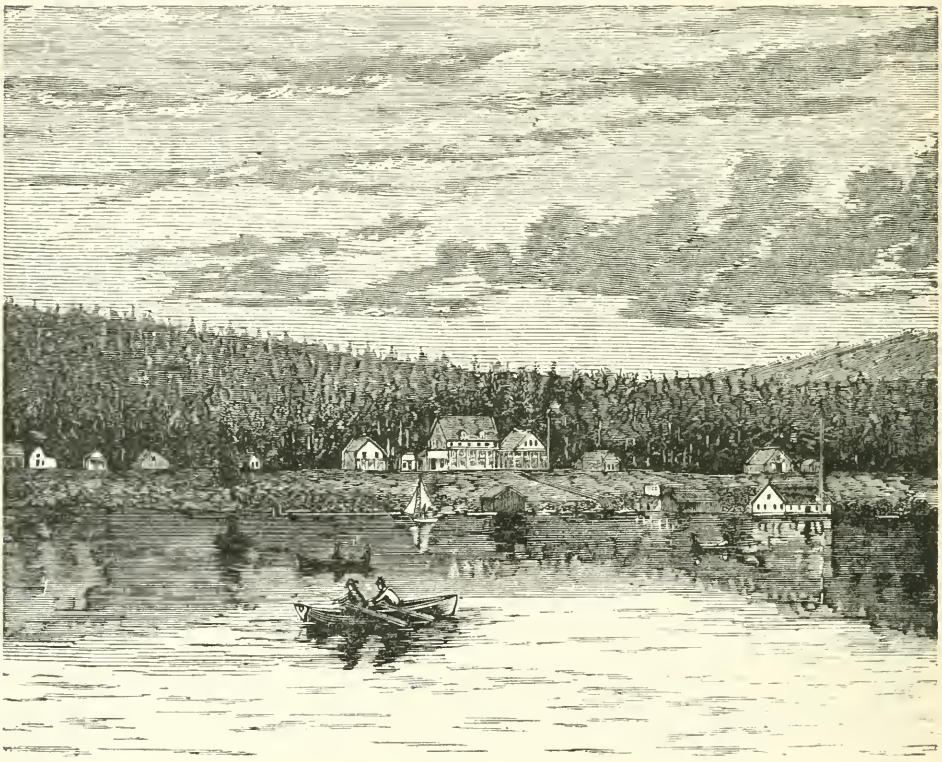
"O, lovely lake, while life remains,
Will thy enchantment hold my heart!
And song rehearse in willing strains,
Lake of the hills! how fair thou art!"

These hot and cold mineral springs are located on Carnelian Bay, at the northern end of Lake Tahoe, in Placer County. They form part of the attractions of this famous inland sea. They are reached by railroad to Truckee, and then by stage over a good mountain road for about two and a half hours' drive.



The scenery is grand. The Truckee River is crossed and recrossed. Mountain sides and heights are scaled. Fertile valleys, grazed by immense herds of cattle, are traversed. Forests of beautiful pines and cedar rear themselves at intervals. Humming sawmills fill the air with life, and wild, romantic views, greet one at every turn. The appointments of the resort are most complete in every detail. There are about fifty boiling and cold springs on the lake shore. They are well kept and cared for. Excellent bathing facilities have recently been erected, where

cold and hot sulphur baths, tub and plunge, can be taken. There are also steam baths, and the resort has become very popular. The baths are used with success by the rheumatic and gouty. The waters are also drunk for liver and kidney diseases, chronic constipation and cutaneous affections.



TAHOE CITY

The waters are sulphurous and saline, and a few are carbonated. They contain:

Sodium Chloride.
Calcium Sulphate.
Magnesium Sulphate.
Silica.
Organic Matter.
Free Sulphureted Hydrogen Gas.

The elevation is 6,250 feet. Bronchitis, asthma and consumption do well among the pines at this place. There are splendid facilities for camping, hunting and fishing.

KELLOGG'S SPRINGS

These mineral springs are located near Calistoga, in Napa County. The waters are saline and sulphureted. They are the private property of Mr. Foulkers. No development.

LANE'S MINERAL SPRINGS

Some thirty-five miles east of Stockton, in Calaveras County, lie these springs. They are about 1,000 feet above sea level and surrounded by hills and vales and forests of pine. The main spring flows fifty to seventy-five gallons per hour and the water is alkalo-sulphurous and chalybeate. The following analysis is supposed to have been made by the San Francisco Refining and Analytical Association and sent to me by the owner of the springs. The analysis is probably not correctly printed on the report furnished the writer:

LANE SPRINGS

S. F. Refining and Analytical Association, Analysts

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains
Carbonate of Iron	122.000 (?)	Lime Carbonate	18.012
Magnesia Carbonate	38.512	Free Sulphuric Acid?	15.237
Epsom Carbonate (?)	29.764	Silica	15.196
Alumina	2.009	Organic Matter	2.723
Soda Carbonate	8.524		

Total Solids, 251.977

Free Gases	Cubic Inches
Sulphureted Hydrogen	105.

The water has been in use for several years and is said to be beneficial in constipation, dyspepsia, chronic malarial poisoning, liver and kidney complaints. For bathing the waters are artificially heated.

LAS CRUCES HOT SPRINGS

These hot sulphur springs are located in Santa Barbara County, forty-two miles from the city of the same name. The waters are saline and sulphureted. The prin-

cipal spring flows five hundred gallons per hour and has a temperature of 90° F. The waters are much used locally for skin diseases.

LICK SPRINGS

These are described under the head of Tuscan springs, of which they form the first two or three. The Lick springs were discovered in 1856, and soon afterwards the waters were subjected to chemical analysis with the result of obtaining large crystals of borax—the first borax discovered in the State. These crystals are still preserved in the Academy of Sciences.

LITTLE GEYSER SPRINGS

These consist of several small jets of hot steam issuing through the earth's crust at a temperature of 190° F. to 200° F. They are located three or four miles below the Geysers, in Sonoma County.

LITTLE YOSEMITE SODA SPRINGS

They are located on the north fork of Kern River, in Tulare County. The waters are palatable, alkalo-carbonated, impregnated with ferruginous salts. Used locally.

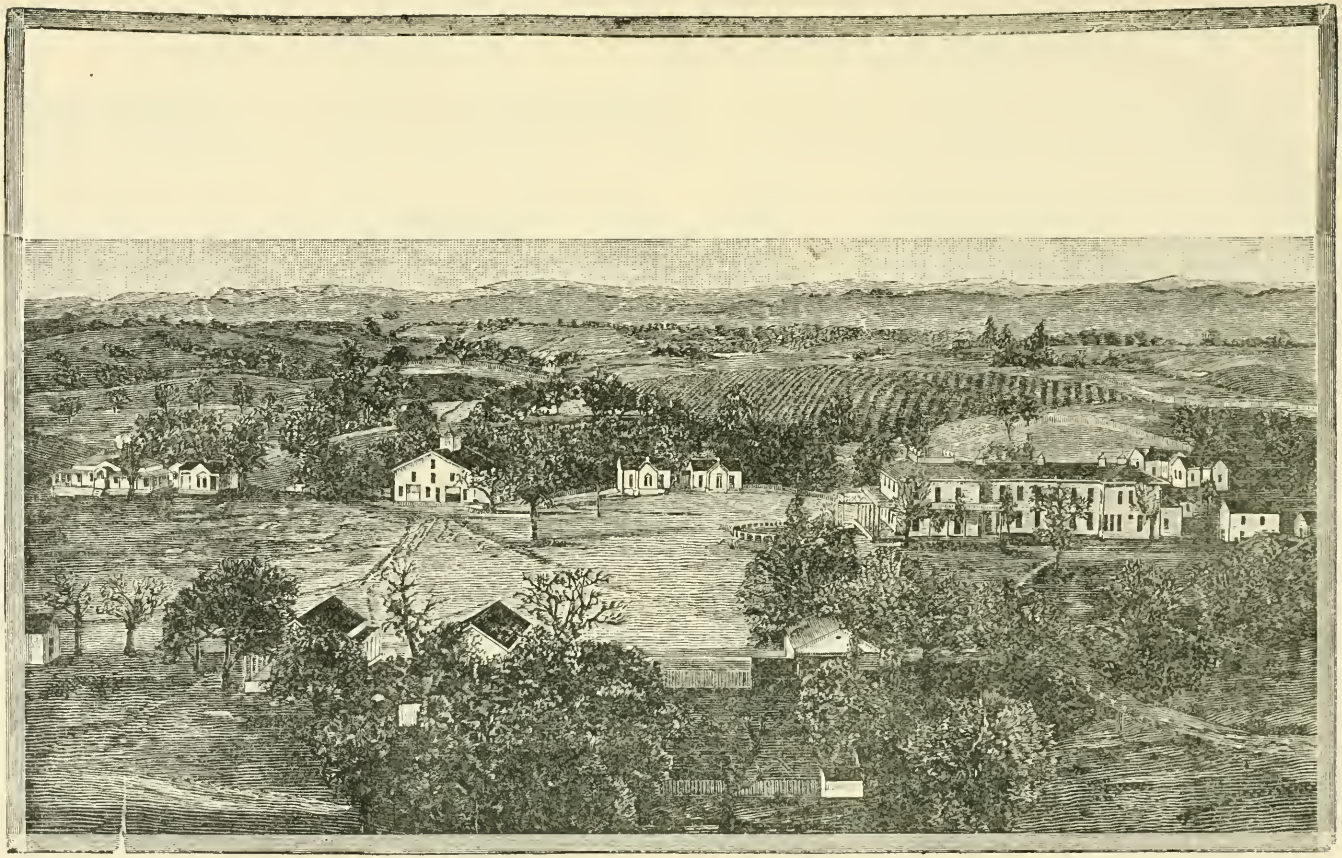
LITTON SELTZER SPRINGS

These excellent seltzer and soda springs are located about four miles north of the city of Healdsburg, in Sonoma County, on the line of the San Francisco and North Pacific Railroad.



LITTON SPRINGS

The springs and adjoining property—about 1,000 acres—have been incorporated, and extensive buildings, hotels, cottages and dwellings, as well as the improvement of the springs and grounds are contemplated. The Litton Springs have gained in reputation, and much of the water is used locally and commercially. The water is slightly acid when freshly drawn, but by exposure it soon becomes alkaline on account of the evaporation of the carbonic anhydride. It is much used as an antacid in dyspepsia, and in uric and lithic acid conditions of the urine. It has also aperient and diuretic properties. From the largest spring the flow is twenty gallons per hour. During the wet season it increases.

LOWER SODA SPRINGS

Opposite the mouth of Castle Creek in the Sacramento Valley, and on the Shasta Scenic Route in Shasta County, are two important soda springs. The upper one is about three and one-half miles farther up the canon, and about eight miles from Strawberry Flat, at the base of Mt. Shasta. The lower soda spring has an elevation of about 2,100 feet, and the upper spring that of 2,363 feet. The springs have gained considerable reputation among and are resorted to by many people suffering from uric or lithic acid, gravel, cystitis, nephritis, and albuminurea. The waters are alkaline and carbonated, and contain considerable quantities of iron salts. The temperature of the water is 52° F. The surrounding country is wild and picturesque, and a public resort has been established for the comfort of travelers from Mt. Shasta.

MADRONE MINERAL SPRINGS

These springs are situated some twenty-five miles southeast of San Jose, and about five miles north of Gilroy Hot Springs. They are at an elevation of about 2,200 feet, and beautifully located at the foot of "Pine Ridge." The mountain roads and drives are in good condition, and the scenery along the route is as fine as any in the State. At the springs we find ample accommodations, good bathing, hot or cold, and pure, bracing mountain air. The waters are "soda" impregnated with iron, and surcharged with carbonic acid gas. There is also an iron spring, and an alkalo-chalybeate spring containing arsenic, and another called white sulphur. The waters are used in the treatment of syphilis, rheumatism, skin diseases, etc., etc.

Route of travel is by the Southern Pacific Railroad to Madrone sixty-nine miles, and thence by stage twelve miles to the springs.

"MAGNETIC" MINERAL SPRINGS

These alkalo-chalybeate springs are found in Santa Cruz County near Watsonville. The waters are sold as a remedy for a great many diseases. No analysis.

MARK WEST SPRINGS

This mineral water resort is situated eight miles from Santa Rosa, near the famous "Petrified Forest," on Mark West Creek, in Sonoma county. It is reached by rail to Calistoga or Santa Rosa, and thence by easy carriage or stage to the springs over one of the most picturesque drives in that section of the country. During my recent visit, I observed that the mountains along the road were being cultivated, and beautiful villas and private mountain resorts were springing up in all directions. Extensive orchards of prunes and other fruits have been planted, and the whole country is active.

The springs are beautifully located at an elevation of 800 feet, in a small valley formed by the junction of four canons. The hotel and grounds are at the bases of three venerable mountains, called "Mt. Washington," "Mt. Lincoln" and "Mt. Grant." The temperature of the air ranges from 80° to 90° F., with pleasant, cooling and bracing sea breezes. The atmosphere is clear and dry.

There are excellent hotel accommodations and several cottages for family use. Hot sulphur and hot mud baths have been constructed with every facility for comfort and benefit. On the place are several springs. One large sulphur spring flows about 200 gallons per hour, and has a temperature of 82° F. The water is clear and not disagreeable to the taste. Its composition is:

Sulphate of Sodium.
Sulphate of Magnesium.
Salts of Potassium—trace.
Chloride of Sodium.

Carbonates of Sodium, Potassium and Lime, Silica and Alumina. It has also gases of carbonic anhydride and sulphureted hydrogen.

There is also an iron spring containing carbonate of iron, soda, magnesia and lime, with free carbonic acid gas. This is a highly chalybeate water, and has successfully treated many conditions requiring ferruginous tonics. The flow of this spring is 600 gallons per hour, and the water has a temperature of 65° F.

The largest spring has a flow of 5,000 gallons per hour; this is a sparkling carbonated water, very palatable, and gently aperient in its action. It is much used in dyspepsia arising from too free alcoholic stimulation, with the concomitant liver and kidney disorders. It is said to have vastly benefited patients suffering from chronic Bright's disease. The iron spring is used as a tonic, and the sulphur spring for cutaneous diseases, rheumatism, etc. The baths are sulphurous.

Analyses of these waters can not be made in time for publication.

MATILIJA HOT SPRINGS

They are located six miles from Nordhoff and fifteen miles from San Buenaventura in Ventura County. There are twenty-eight springs in all. They vary in temperature from 35° F. to 160° F. The average flow is 5,000 gallons per hour. Most of the hot springs are sulphureted and much used for syphilitic contaminations, strumous and skin diseases, rheumatism, etc. There is a comfortable hotel and resort at the springs.

MINERAL SPRINGS

Several springs by this name are found in Grizzly Cañon. The waters are salino-chalybeate, and charged with carbonic anhydride. No improvements.

McCARTHY'S HOT SPRINGS

Near Day's ranch, northeast of Fort Crook in Shasta County are located these mineral springs. Some of the water is reported sulphurous in character and the other ferruginous and carbonated. There is a local resort.

MILLS' MINERAL SPRINGS

About one mile above Anderson's resort in Lake County we find these springs. They are four in number. The hottest has a temperature of 170° F. The waters are principally sulphureted and saline, and the resort is growing every year. Good accommodations and splendid hot sulphur bathing can be found here. The surrounding country also affords excellent sport with the gun and rod.

MINERAL SPRINGS

Several springs, as yet unnamed, are known as mineral springs. Many of them are used locally.

Some of these are located twelve miles north of Wigginsville, in Siskiyou County.

Others are found on the east slope of Mt. Shasta, in Siskiyou County.

West of Butteville, in Siskiyou County, are found some more.

In Alpine County, on the mountain near Silver Lake, are several cold soda springs.

In Calaveras County are quite a number of mineral waters, especially in Salt Spring Valley. These waters are alkaline and rich in chlorides and carbonates.

On the west shore of Mono Lake in Mono County, lie several large calcic springs.

In Los Angeles County on the Encino ranch are a number of warm alkaline and carbonated springs having a temperature of 83° to 90° F. The waters are in local use.

In San Bernardino County, three miles above the mouth of Little Creek cañon are some warm springs, temperature 92° F. to 95° F.

MISSION SAN JOSE HOT SPRINGS

About two miles southeast of the Mission San Jose, in Alameda County, are some notable springs. They were well known to the early Mexican and Spanish Fathers. There are four of these springs in use to-day, having a temperature of 80° F. The waters are alkalo-saline, having small quantities of carbonic anhydride and sulphureted hydrogen. Considerable local demand has been found for the waters.

MONO BASIN WARM SPRINGS

These waters are chlorinated and alkaline, and are located on the northeast shore of Mono Lake, in Mono County. The temperature varies from 85° F. to 90° F. Unimproved.

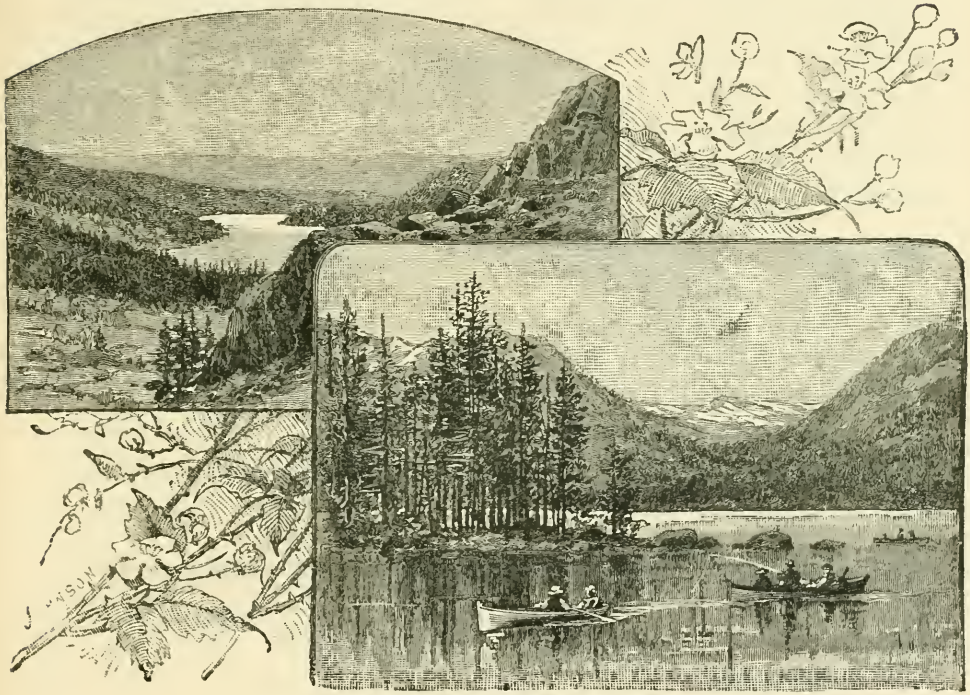
MONO LAKE

This remarkable body of water is located near the center of Mono County, about ten miles south of the town of Bodie. The altitude is 6,730 feet. The length of the lake is, from east to west, about fourteen miles and its greatest breadth nine miles. The lake has been likened by Prof. W. F. McNutt (in his article on the mineral and thermal springs of California, read before the Ninth International Medical Congress) to the Dead Sea of the Holy Land. The same may be said of Owen's Lake (Hank's). At one time Mono Lake must have been much larger than it is at present, which is shown by the large terraces on all sides. The lake receives much of its water and its chemical salts from the rivers and creeks which flow through volcanic soil and empty into it. By evaporation of the water and the concentration of the salts deposited here for many centuries the mineral ingredients will undoubtedly prove valuable just as soon as man can separate and utilize them. (State Mineralogist.)

NEVADA FALLS

Numerous springs are found all over the Lake. The most curious of these are some of the fresh water springs holding in solution small quantities of calcium carbonate, which precipitate and deposit around the openings of the

springs, forming irregular tubes, clustered together in columns. These vase-shaped structures are ten to forty feet long, rising from the bottom of the Lake upward and above the surface. In the center of these columnar pillars are small holes, through which flows this sweet water. These overflowing fountains have very aptly been likened to the sponges found in the South Seas and known as "Neptune's cups." In Mono Lake we find several islands, some two or three miles long. Their composition is of volcanic



GEMS OF THE SIERRAS

material, and all over the surface are hot springs and jets of hot steam, making the surrounding water quite warm. On one or two of these little islands are small craters fifty or more feet in diameter. They are now filled with water.

All around Mono Lake are unmistakable evidences of great volcanic activity during the tertiary and post-tertiary periods, and undoubtedly Mono Lake itself is a large extinct crater.

The water, being likened to the Dead Sea, was supposed to be destitute of life. This, however, has been proved to be an error. There are found small, curious, wormlike, minute organisms, plainly visible to the naked eye, in the water near the surface. They seem to swim on their backs, and resemble the oars of a Venetian gondola or that of the Argo, noted in ancient mythology (Hanks). It is extraordinary that a water so constituted has vivifying power enough to sustain even these minute organisms, as there is found to be nearly 3,000 grains of solids in each gallon. The larvæ of these animals are thrown upon the shores of the lake by the waves, and there accumulate in large quantities. Here the Indian gathers them, and when dried they form one of the delicacies of the red man, who is said to delight in them, as did the good people delight in the locusts and honey in the days of yore. The scenery in and around Mono Lake is grand, and well worth the trip. Situated as it is at so high an elevation, and surrounded on all sides by snow-capped mountains, a picture is presented to which only an artist could do justice.

The water itself is more like a bitter brine to the taste than mineral water. Its action is excessively diuretic, even in small quantities.

On analysis this "Dead Sea" water is found to contain .

MONTECITO HOT SPRINGS

A LETTER FROM THE ABLE PEN OF REV. A. H. CARRIER.

Everyone in Santa Barbara knows something of the hot springs, Montecito. Not every one has learned the charm of the place by personal observation and experience. At an elevation of 1,460 feet above the sea in the heart of the most picturesque ravine with mountain walls rising almost perpendicularly around, with an opening toward the ocean and its outlying islands so that these seemed framed into a picture of extraordinary beauty, the place itself is unparalleled in its attractions by any spot along the line of our coast.

Winding around the spurs of the mountain a walk from the hotel, so well graded at present that an invalid would find no difficulty on it, leads to the famous Lookout Point from which the long-reaching valley and the Pacific beyond are seen stretching at one's feet. Santa Barbara seems so near that you feel that you could signal to your friends.

To one who cares to climb, the peak, 1,500 feet above, as I can testify, is exceedingly grand in its combination of mountains, of deep ravines, of distant peaks, of the San Rafael range, of the coast line from Hueneme to Gaviota, together with the boundless expanse of the ocean. The scene suggests the famous view from the Righi and from Mount Pilatus in Switzerland, with the added sublimity in this case of the vast Pacific.

As a sanitarium the Hot Springs afford what one might travel far to discover. The water issuing from the rocks at 120° Fahrenheit, charged with sulphur and other minerals, is Nature's own healing remedy, efficacious to a high degree in complaints of a rheumatic nature. Almost instant benefit is experienced by many persons from the combined external and internal use of these waters. The sense of rest after fatigue from these baths is something marvelous.

These hot springs are located five miles from Santa Barbara City in the same county. The waters are sulphurous and nearly all boiling hot. A resort is being erected for the treatment of invalids. Also suitable bathing facilities are being provided.

MOUNTAIN GLEN HOT SPRINGS

Some twenty-five miles north of Santa Barbara are found these springs. They are mostly sulphurous, and have a temperature from 60° to 100° F. There is a local resort.

MUD SPRINGS

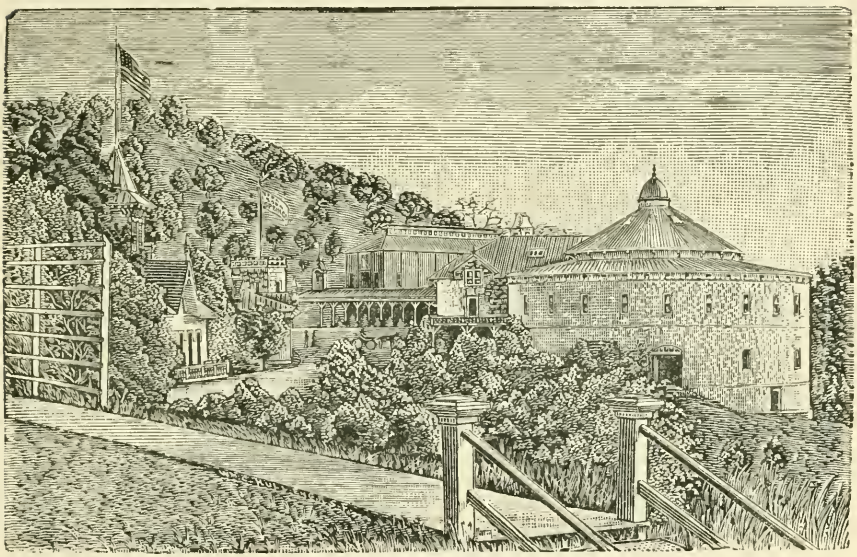
Extensive hot mud springs are situated fifteen miles northeast of Honey Lake, in Lassen County. The property is unimproved.

Also on Antelope Creek, about ten miles east of Red Bluff, in Tehama County, is another region of hot mud springs. No analysis and no improvements.

NAPA SODA SPRINGS

These celebrated mineral springs are charmingly located on the southwestern slope of the Coast Range, about fifty miles from San Francisco and six miles from Napa City. The elevation is about 1,000 feet above the sea.

They are reached by ferry and rail to Napa City and thence by easy carriage to the springs. This drive from Napa to the springs is exceedingly pleasant. You pass neat and cozy farmhouses and homes, green pastures and



NAPA SODA SPRINGS

well-tilled fields, orchards, vineyards and groves. The air is fragrant with the perfumes of wild and cultivated flowers and resonant with the harmonious songs of a thousand birds. One feels envious of the quiet and peaceful rural life when thus contrasted to the busy whirl of the western metropolis.

As you speed along, "Napa Resort" is seen in the distance, looming up like an ancient fortress along the Rhine. At the end of a short hour you arrive at the Rotunda Hotel. Here the scenery is charming; a thousand feet above the valley and at the head of the cañon, you have

full command of the country for miles around. Looking southward over the beautiful valley of Napa County, one sees a landscape which has probably never been surpassed for beauty, one which forever remains fresh in his memory. The green fields, cultivated farms, orchards and vineyards, gardens and houses, checkered here and there in an irregular manner, with their straight and winding lanes, creeks and rivers, with groves of stately oaks, and in the distance the San Francisco Bay, glistening and rippling in the sun's rays, blend to make a harmonious whole, to which only the trained pencil or brush can do justice. To the westward may be seen the great Pacific, guarded by its sentinel, Mt. Tamalpais, and the many ranges of mountains and hills. To the eastward Mt. Diablo looms up in the distance, half veiled in violet mists. To the north we see Mt. St. Helena and the Coast Ranges with their rich, alluvial valleys.

The local picture of Napa Soda Springs is scarcely less interesting. We find groves of oaks gracefully festooned with immortal mistletoe, the tall and stately pine and the eucalyptus globulus. We also find the Italian cypress, the palm, the olive, the fig and the orange tree, the odorous California buckeye and the fragrant laurel, the maple and the madrona, and tangled copses of flowering shrubbery everywhere.

Lawns and flower-beds, cultivated and natural, with the many shady nooks and cozy outlets—combined nature and art—produce as lovely a spot as the tired business man with his family, or the invalid with his many ailments, could possibly find. The climate is warm, dry and salubrious, and the resort has the mountain air and the sea breezes as well.

The mineral springs are among the most noted in the State. They number twenty-seven in all, with an average daily flow of about 4,000 gallons. The temperature of the water ranges about 65° F. to 68° F. The main spring, the Pagoda, from which most of the commercial Napa soda is obtained, had a temperature in 1888 of 67.7° F. This is an

alkalo-chalybeate water strongly charged with carbonic anhydride, delightful, clear and sparkling, and has an agreeably pungent taste.

Over the Pagoda spring, engraved on a marble tablet, is the following invocation, a *fac simile* of one inscribed by Imperial decree above the springs at the famous Carlsbad, in Bohemia:

"To suffering man from Nature's genial breast
A boon transcendent ever mayst thou flow;
Blest holy fount; still bid old age to know
Reviving vigor, and if health repressed
Fade in the virgin's cheek, renew its glow
For love and joy; and they that in thy wave
Confiding trust and thankful lave,
Propitious aid, and speed the stranger band,
With health and life renewed, unto their native land."

NAPA SODA

The "Lemon Spring," or the natural Napa soda lemonade, flows considerably less than the Pagoda Spring. The water, however, is even more valuable as a tonic, containing more ferruginous salts. The lithium makes it beneficial in kidney diseases. Otherwise the water is very similar in its aperient and diuretic properties, as may be seen from the following analysis:

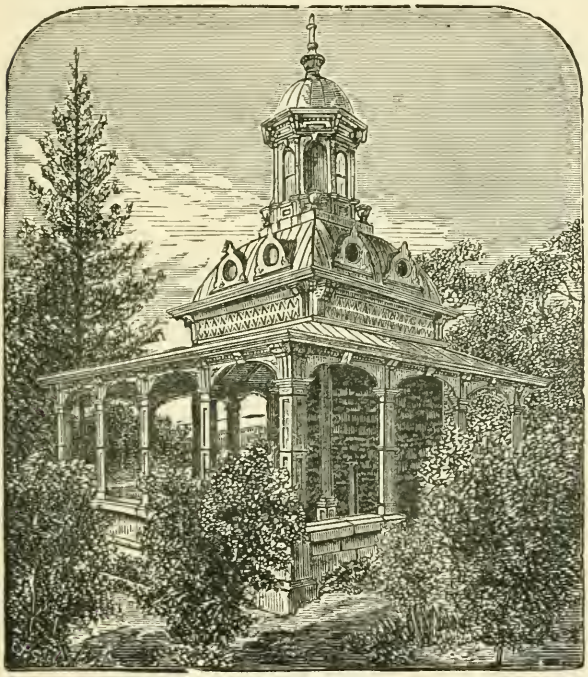
NAPA SPRINGS

The many other mineral springs at Napa Soda resort are very similar in composition. The waters are all alkalo-chalybeate, clear, cool and sparkling.

Napa Soda is highly esteemed as a beverage. It is sold in every city and town on the coast, and is one of the pleasantest summer drinks we have.

The water is an efficient aid to digestion, being antacid and tonic. When taken in the morning before breakfast its action is gently aperient. The ferruginous salts held in solution by the carbonic acid gas are valuable in anæmia and chlorotic conditions, malarial toxæmia and many disorders requiring iron for the constructive metamorphosis of red-blood corpuscles. Much benefit is derived from a course at the springs in Bright's disease of the kidneys and chronic cystitis, in acid conditions of the blood and urine, dyspepsia and indigestion, etc., etc. The Napa Soda Springs have also proved beneficial in the treatment of chronic and subacute metritis and ovaritis, and this water is better borne by the stomach in these and the many allied uterine complications than almost any other chalybeate tonic.



PAGODA SPRING

In the many cystic and nephritic disorders found on this coast these alkalo-carbonated and chalybeate waters have been found of great value.

The resort is open all the year round. The excellent climate, the high and dry location and the elegant accommodations add greatly to the comforts of the health and pleasure seeking public.

The Rotunda Hotel is a magnificent structure. It is built of solid stone masonry, quarried in one of the adjacent mountains on the extensive grounds. The rock is white and soft when first exposed to the atmosphere, but it rapidly parts with its moisture and becomes harder and harder the longer it remains in the air. The rotunda is a circular building, towering up seventy-five feet into the air and surmounted by a huge glass cupola which reflects the rays of the sun for miles around.

The structure is one hundred and twenty feet in diameter, and its interior is a fine work of mechanical art. The court, or grand central parlor, is about one hundred feet in diameter, handsomely furnished and lighted by a large gas chandelier of forty lights. Surrounding the parlor is a promenade, and exterior to this again are arranged apartments for guests, single and in suits. From this building the entire extensive grounds and landscape may be surveyed.

Picturesquely arranged on different portions and elevations of the premises are located the many handsome edifices belonging to Napa Springs, the most of which are built of stone, and have gas and running water in every room. There is the "Club House," in which are found all the various amusements, billiard tables, bowling-alleys, bagatelle tables, etc., for the use of the guests. The "Tower House," "Ivy House," The "Bellevue," "Garden House," "Music Hall," "Bottling House," and cottages are all at the disposal of the guests, as also lawn tennis and croquet grounds beautifully situated.

The waters are bottled fresh from nature's subterranean laboratories at the springs, and only natural mineral waters and gases are sent from the Soda Springs.

The dining hall deserves a passing notice, not only on account of its external architectural beauty, but for its excellent interior contents. The *cuisine* is in charge of an experienced *chef* and the *table d'hote* is superior, consisting of pure fresh milk, butter and eggs of country production, fresh vegetables and fruit from the gardens and orchard on the place, and the most nourishing and appetizing foods with all the delicacies of the season.

The extensive grounds cover over a thousand acres of hills and valley. The place is also well supplied with springs of fresh water, rippling over rocks and rills forming cascades and mountain streams which play over the pebbles or gently glide along the moss-covered banks. There are also splendid facilities for hot and cold Napa Soda baths in tub or plunge, and a swimming-bath measuring 150 feet in length by 50 feet in width, with water varying from 4 to 10 feet in depth.

Our sojourn at this resort during 1888, although necessarily brief, was, nevertheless, exceedingly pleasant, and we do not hesitate in pronouncing Napa Soda Springs one of the most delightful and salubrious watering-places on the Pacific Coast.

Newsom's Arroyo Grande Springs

About 14 miles south of San Luis Obispo lie these springs. They are reached by rail to Arroyo Grande and thence by easy stage or by drive from Nipomo. The situation is a pleasant one at an altitude of about 400 feet. The grounds and springs are well kept. The ocean beach road affords one of the finest drives in that section of the country. At the beach, swimming, fishing, and clamming are always in order. The hotel and cottages are pleasantly situated and afford good accommodations for guests. The climate

is one of almost perpetual sunshine with occasional spring and fall rains. On the place are three principal springs whose waters range in temperature from 40° F. to 100° F. and flow the enormous amount of 49,000 gallons per hour. The waters are salino-sulphureted and have gained considerable reputation in the treatment of old chronic rheumatism and gout, catarrhal affections of the bladder and bowels, skin diseases, etc. For uterine troubles the hot sulphurous douche has been of great benefit.

Warm and hot plunge and tub bathing facilities have been constructed for the use of guests.

New Almaden Vichy Springs.

These springs are situated in the Coast Range of mountains, about 60 miles south of San Francisco. They are near the New Almaden Mines in Santa Clara County. The

climate is lovely and mild during the whole year. At the springs has been erected a pretty little resort, which is growing in favor. The water is a heavy alkalo-chalybeate strongly charged with carbonic acid gas.

NICHOLAS SPRINGS

They are located in Santa Cruz County, on Mr. B. C. Nicholas' Ranch.

The water contains large quantities of Epsom salts and iron salts.

Ojai Hot Sulphur Springs

These springs are beautifully situated in Waterfall Canon, about five miles from the prosperous village of Nordhoff and fifteen miles from Ventura, in Ventura County. The route is to Ventura by Southern Pacific Railroad and thence by stage. The altitude at the springs is about 1,000 feet. Good accommodations are afforded at the growing resort and the vicinity boasts of fine fishing, hunting and scenery.

The springs flow about 50,000 gallons per hour and have a temperature ranging from 60° F., to 74 to 104° F. Several of the springs are carbonated and others are sulphureted.

The "Fountain of Life" spring is a cool soda; "St. Jacob's Well" is also cool and carbonated. One large spring was discovered by a man named Adam and the most natural thought for an Adam to have was of his tempter "Eve," so he named this water the "Mother of Eve." It is soft and heavily charged with sulphates and sulphureted hydrogen, and although the water tastes well enough, its smell is anything but agreeable. The water has a reputation for whitening and softening the skin and improving the complexion.

These Ojai waters contain: sodium, potassium and magnesium, carbonates and sulphates, calcium and ferrous carbonates, silicates, carbonic anhydride and sulphureted hydrogen gases.

Many people go there who are stiff-jointed, rheumatic and gouty, or affected with skin diseases, etc. They are all reported as receiving great benefit.

Owen's Lake

This second "Dead Sea" in California is located at the southern end of Owen's Valley in Inyo County. It is eighteen miles long and ten miles wide and its waters are highly chlorinated and alkaline.

On analysis the lake water yields, according to Chemist Philips of London:

OWEN'S LAKE.

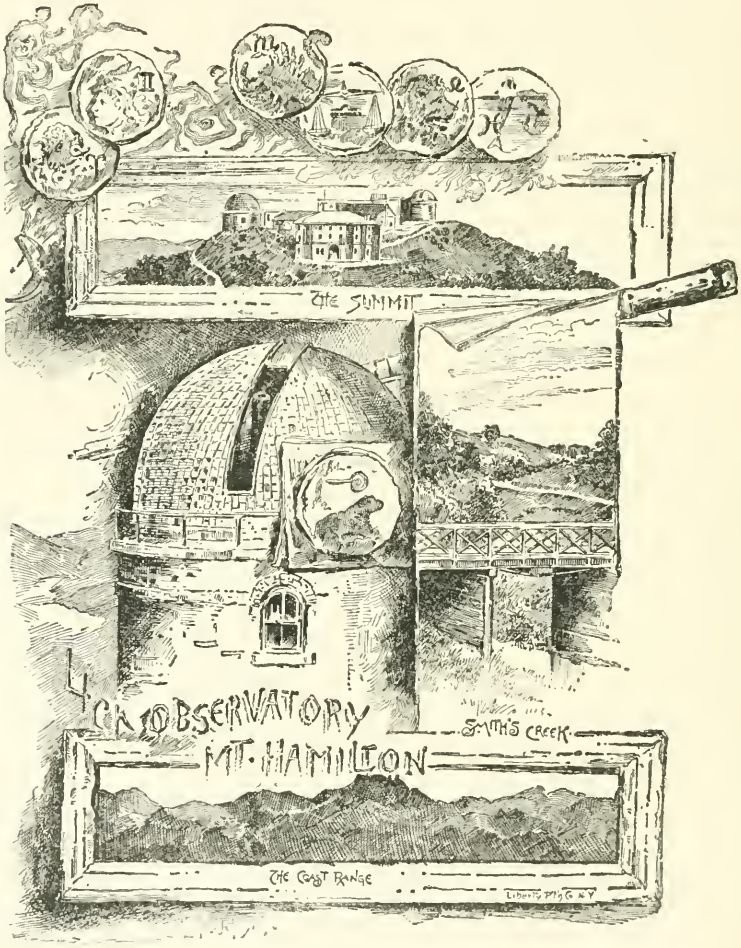
The most important of the auxiliary attractions of San Jose is the Lick Observatory on the summit of Mount Hamilton. A few years ago James Lick, a wealthy citizen of San Jose, gave his entire property, consisting of nearly five millions of dollars, to philanthropic institutions and and works of public improvement in the State. The most important of these bequests was that of $750,000 for the establishment of an astronomical observatory on Mount Hamilton, which was to be equipped with the most powerful telescope in the world. Mount Hamilton is located in the range of mountains east of the valley, and is twenty-six miles distant from San Jose. It stands 4,443 feet above the level of the sea, in an atmosphere cloudless during the entire year. From its summit there is an unbroken horizon, while its latitude is favorable for the most important observations. The county of Santa Clara has constructed, at an expense of about $100,000, a magnificent road to the top of the mountain. This road is of easy grade, finely constructed, and furnishes a beautiful drive. The scenery along the

route is unsurpassed for beauty and grandeur. The work on the observatory and adjacent buildings has been completed and the placing of the crown disc for the great thirty-six-inch telescope (the largest in the world) has been accomplished. The buildings and instruments now completed



and in position are the observer's house, and the thirty-six-inch telescope, the transit house, the photo-heliograph and photograph house, the north dome and the fifteen-inch equatorial refractor, the meridian circle house and the six

and one-half inch meridian circle; many auxiliary instruments, such as chronometers, sidereal clocks, etc., and a number of portable telescopes. The dome which covers the great telescope is made of steel plates; it is seventy-five feet in diameter, and weighs about one hundred and twenty-two tons.

Pacific Congress Springs and Sanitarium

These famous mineral springs are located in the Coast Range of mountains, about twelve miles southwest of San Jose, in Santa Clara County. They are so named from the similarity which exists between the waters of these springs and those of the noted Congress Springs at Saratoga, New York.

Santa Clara Valley is celebrated for its excellent climate and dry, pure and invigorating atmosphere, a place admirably suited for a health and pleasure resort where the cares of a busy life may be forgotten for a while, and where one can bask in the sunny smiles and breathe the perfumed air, and admire the picturesqueness of the place.

A large and commodious hotel and several cottages have been established at an elevation of seven hundred and thirty feet above the sea level. Excellent bathing facilities for hot and cold mineral baths have also been constructed. Some one hundred feet farther up the mountain side are the springs—purposely so arranged in order to give the guests a little walk to and from the springs.

The drives in and about Congress Springs are among the finest in the State, everything is first class, entertaining and pleasing, and thousands of people go there yearly for their health and recreation.

Route of travel—the Southern Pacific Railroad to Los Gatos, and thence by stage or carriage to the springs.

There are several springs on the premises, which flow in great profusion. The waters belong to the alkalo-chalybeate class, so valuable for table purposes. Their action is

mildly aperient (from the presence of the Glauber's and Epsom salts), diuretic from the large amounts of carbonates, and antacid from carbonic acid gas, which forms alkaline carbonates with metallic bases. The waters are also largely tonic and ferruginous from the large quantity of iron salts.

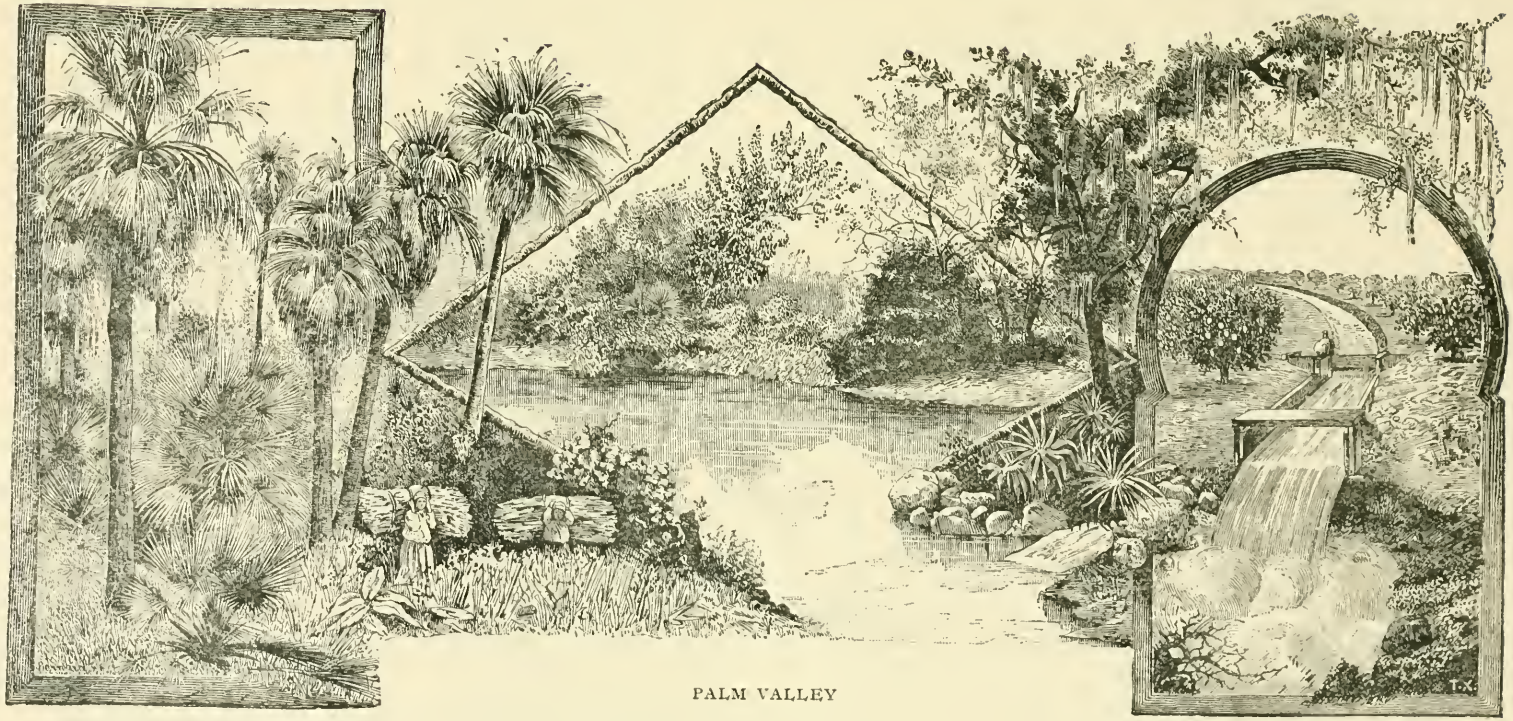
This water has gained considerable celebrity in the treatment of anæmia, dyspepsia, liver and kidney troubles, irritability of the bladder, rheumatism, gout and cutaneous affections. The waters are shipped to all parts of the coast and are extensively used.

THE VALLEY OF PALMS

NO SUCH CLIMATE OR SCENERY ELSEWHERE IN THE UNITED STATES

Hundreds of lofty palms, with slender trunks towering seventy-five to one hundred feet in the clear atmosphere, crowned with magnificent clusters of fruit from ten to twelve



PALM VALLEY

feet in length. A hot mineral spring, fed from a natural well reaching far into the bowels of the earth, and whose waters have for years been known as a specific for rheumatism and all kinds of blood diseases. A fertile soil, whose genial properties cause fruits and vegetables to ripen a month and more in advance of any other part of the State. A balmy climate where frost and fog are practically unknown and where the most delicate invalid finds a canvas shelter comfortable the year round. Beautiful mountain streams pouring their wealth of water from the melting snows into the valley. In the background a lofty mountain range, towering over two miles into the blue ether. All this, and more, too, go to make up the principal natural advantages which the visitor finds at Palm Valley, in the northeastern part of San Diego County. This remarkable, and in many respects incomparable, valley lies at the foot of the southeastern slope of the grand San Jacinto Range, and a few miles from the valley, called the San Gorgonio Pass, which separates the range mentioned from the San Bernardino Mountains. For ages this valley, with its wonderful hot springs, or Aguas Calientes, has been known to the aboriginal inhabitants, and they have been accustomed to resort hither for the cure of their various ailments by bathing in the health-giving waters. Their legends of this region are numerous and interesting, including that of Tah-Quish, the demon of the mountains and the beautiful White Spirit, who is the guardian angel of the spring. From the very earliest occupation of the white settlers in California these springs have been well and favorably known. People from every direction flocked hither for the certain cure of manifold diseases which followed bathing in the waters. Gradually, a few white settlers have made homes here, and they learned by experiment the remarkable fact that fruits and vegetables would mature here at least six weeks earlier than in the earliest regions of other parts of the State. Taking the fertile soil, the marvelous climate and the wonderful springs, here was a combination of advantages which could

not fail to be of the greatest value. A couple of years since, some capitalists secured possession of several thousand acres of land, constructed a stone-paved canal, ten miles long by which the water of Whitewater River was diverted upon the Palm Valley lands, and then established a settlement here which is manifestly destined to take a front rank among the health resorts of the world. They have also planted a tract of one hundred and forty acres with choice oranges and made many other improvements. Consumptives, rheumatics and other sufferers find almost immediate relief in the pure, dry air of Palm Valley, and the list of cures that have been effected here is, indeed, marvelous.

Paert's Hot Springs

Near Benton, in Mono County, lie several hot springs. The waters are salino-sulphurous and used locally. No analysis.

Paraiso Hot Springs and Sanitarium

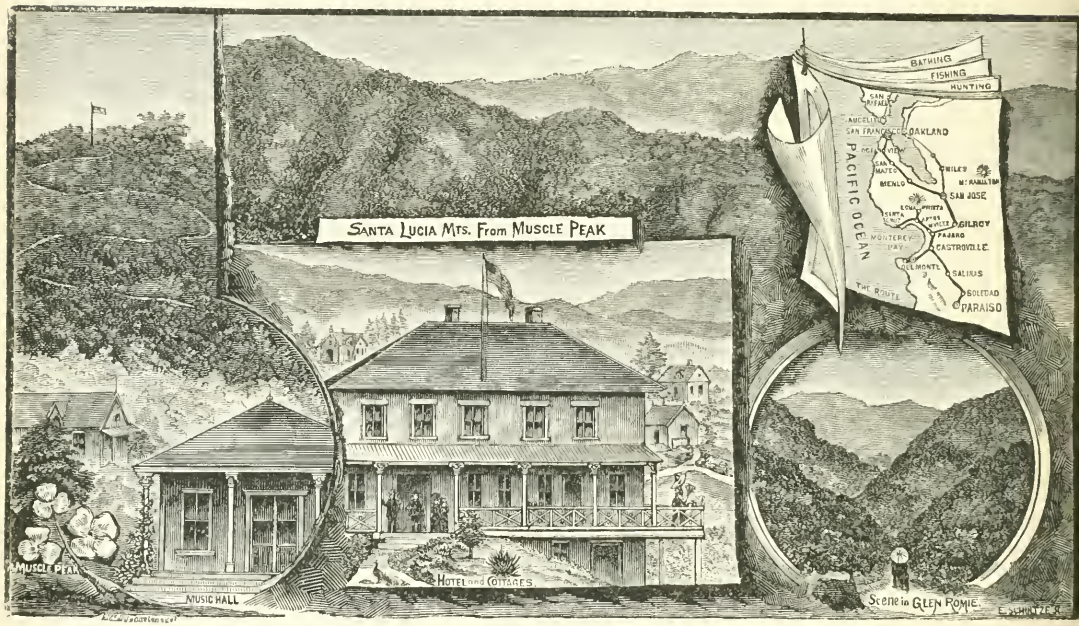
These famous mineral springs are picturesquely situated in their mountainous retreat in the Coast Range, about one hundred and fifty miles from San Francisco and seven miles south of Soledad, Monterey County. They are of easy access by the Southern Pacific Railroad to Soledad and thence by stage or carriage over a charming mountainous drive to the springs.

The Paraiso mineral springs have gained considerable celebrity, having been located by the Franciscan fathers in 1790. The resort is charmingly located in a grotto guarded by three high mountains on as many sides, covered with groves of trees and mountain shrubbery, forming an excellent background to our beautiful landscape. See illustration.

Below the resort, and for miles beyond, is the fertile valley, traversed by the grand Salinas River and Arroyo Seco, and the far-away Gabilan Mountains—altogether forming a picture which only a Bierstadt could delineate.

The climate belongs to that smiling sunny south, whose atmosphere is redolent with the perfumes from the sweet-scented woods and the pine-laden forests, where the ozone and gentle sea breezes are wafted across the mountains to invigorate the fortunate dwellers.

At the springs are the cultivated grounds and gardens, orchards and flowers so pleasing at a mountainous resort.



PARAISO HOT SPRINGS

Here we find the many romantic nooks and commanding outlooks, the winding paths and sequestered retreats leading up and down the mountain sides. "Mussel Peak" and the shaded "Lovers' Walk," with the bright silvered streams below, gliding noiselessly on to the briny deep, afford ample food for the imagination and excellent exercise for the body.

The commodious hotel and cottages are of recent construction, and combine all the luxury and comfort with

convenience and wholesomeless that can be found anywhere. The elevation is about fourteen hundred feet above the sea level. The temperature is equable and the air dry, pure and balmy. Many consumptives and asthmatics do well at these springs.

There is also abundant fishing and hunting in the immediate vicinity.

During the early days of California the friars at the "Old Mission of Soledad," near the Salinas River, used to go up to the springs and receive the sick, who bathed and drank the water and carried much of it with them for medicinal purposes. They named it the Water of Paradise.

On the premises are several valuable springs, flowing about 2,000 gallons per hour, consisting of "sulphur," "soda," and "iron waters."

The Hot Sulphur spring has a temperature of 100° F. Others range in temperature from 105° F. to 118° F.

The following analysis is from the principal sulphur spring at Paraiso.

This water is found to be very similar to the noted Carlsbad of Austria, and of great value in rheumatism, gout, liver and kidney affections and chronic skin diseases.

The waters at Paraiso Springs have been found of great service in chronic rheumatism and arthritic affections, joint diseases, syphilitic and scrofulous contaminations and chronic skin diseases.

The soda and sulphur waters are tonic, antacid, laxative, diuretic and detergent and much prized in dyspepsia, torpidity of liver and intestines, glandular swellings, and for kidney and bladder diseases.

Thousands of visitors, invalids and pleasure-seekers, visit Paraiso Springs yearly and the superiority of the mineral springs, the excellence of the climate and the picturesqueness of the location bid fair to make Paraiso resort one of the most prominent mineral watering-places on the Coast.

PASO ROBLES SPRINGS

See El Paso Robles.

PEARSON'S SPRINGS

These are situated one and a half miles from Blue Lakes and fourteen miles from Lakeport in Lake County. They

are reached by railroad to Calistoga and thence by stage. The springs lie in an elevated valley about six hundred feet wide with large mountains on each side. There are five important springs at Pearson's. One is known as the "Gas Spring" on account of the large amount of carbonic acid gas which constantly bubbles up. The water is a cool salino-chalybeate, having gently cathartic and diuretic properties combined with antacid and tonic. Then there is a "Sulphur and Soda," and a plain "Soda" spring, and the old "Bartlett."

The waters are used for liver and kidney diseases, malarial toxæmia, catarrhal affections, etc.

The water is artificially heated for bathing purposes.

Petroleum Springs

Throughout the State a large number of valuable petroleum springs have been discovered, several of which are worked to good advantage. In Alameda, the first one was discovered in 1868, at the time of the great earthquake, on Mr. Brown's ranch, about four miles east of the town of Livermore. After one of the shocks, a large subterranean explosion was heard which displaced large masses of conglomerate rock and coarse sandstone. Simultaneously, a spring of water commenced to flow near the point of the explosion. As the water issued from the crevice it was observed to be covered with traces of petroleum. Inflammable gas also bubbled up through the water. This suggested the idea of prospecting for oil and gas in the vicinity. Accordingly, a drill hole was sunk about ten feet near the center of the spring. Immediately a dark tarry looking oil escaped. Later on (1875) a well was bored near the spring to a depth of forty-five feet, and water and petroleum commenced to flow. In 1886 several other wells were sunk, one to a depth of one hundred and sixty-five feet, and considerable oil and water continues to flow with bubbles of inflammable gas.

A large natural petroleum well is located in the ocean about one and one-half miles from the shore and about ten miles west of Santa Barbara. Its productiveness must be large, as the ocean water for miles around is covered with the floating oil. Ventura County is known as the "oil county of California." From this natural petroleum county, in 1888, were shipped 226,050 barrels of oil. The wells are from a few feet in depth to several hundred, and in one case 1,400 feet. The crude oils are refined at Santa Paula, yielding—

Illuminating oil	Inflammable gas
Domestic fuel	Distillates
Wood oils	Neutral oils
Lubricating oils	Malta (Bitumen)

Petroleum is found in Santa Cruz, Humboldt, Santa Clara, Los Angeles, San Mateo, Mendocino, Santa Barbara, San Benito, Monterey, San Luis Obispo and other counties in the State, and is forming one of our many valuable industries.

Piedmont White Sulphur Springs

These springs are located in Alameda County, some three miles from Oakland, and have gained considerable local reputation in the treatment of rheumatism, jaundice, liver and kidney and stomach troubles.

The nearness of the resort to the city makes it especially valuable to business men, who can stay at the springs at night and return to San Francisco for business during the day. The resort and grounds are well kept. The hotel is convenient and commodious. The atmosphere is pure and refreshing, with the tonic sea breezes from the bay. The situation, on the western slopes of the Berkeley hills, commands one of the most picturesque views over the San Francisco Bay and the Golden Gate that can be found anywhere on the the coast.

PIEDMONT SPRINGS

CHALYBEATE AND SULPHUR WATERS

These analyses show that the waters are valuable as tonics, antacids, diuretics and aperients, and of value in dyspepsia, constipation, anæmia, rheumatism, liver and kidney troubles.

PIRU MINERAL SPRINGS

Located in Ventura County are a number of undeveloped mineral springs. The Piru is one of these.

RUBICON SODA SPRINGS

These excellent mineral soda springs are romantically situated in the beautiful Garden Valley, on the Rubicon River, some eleven miles west of Lake Tahoe. Everything surrounding them partakes of the picturesque—the tall mountains covered with groves of pine and spruce and capped by old century cedars. Here and there are traces of the slow yet persistent march of huge glaciers of bygone

days; here and there are seen the volcanic sentinels in the form of huge granite pillars silently watching the Rubicon as its bright, silvered stream silently glides along the moss-covered banks. The hillsides are covered with sweet-scented shrubbery, and the valley with flowers, imparting their fragrant aromas to the ozonized mountain atmosphere—a most valuable combination for consumptives, asthmatics, persons suffering with chronic bronchitis, catarrh, etc., etc.

The owner of this beautiful mountainous resort is erecting commodious accommodations for guests and visitors.

The mountains afford ample opportunity for exercise with the gun, as the river does with the rod.

The atmosphere is bright, clear, pure and invigorating, imparting new life to the overworked brain and underworked body of busy city life.

The mineral springs themselves belong to the alkalo-carbonated class of waters, so valuable in the treatment of the many diseases noted under that chapter (*quod vide*), such as dyspepsia and gastric catarrh, torpidity of the liver and constipation of the bowels, Bright's disease of the kidneys, inflammation of the bowels and bladder, etc., etc. For a tonic the waters are excellent. Their action is also diuretic, detergent, aperient and antacid.

They are located at an elevation of 6,200 feet above the sea level, and are pure, clear and sparkling, containing, besides the mineral ingredients, large quantities of carbonic acid gas, so useful in the treatment of stomachic disorders.

New and excellent roads have been built, and the trip to Rubicon Soda Springs is full of picturesqueness and romance as the waters are full of health-giving and restorative qualities.

Salt Lake

There is quite a body of water known as Salt Lake in Mono County, east of the geysers and located in Long Valley. The water is slightly charged with the chlorides of sodium, magnesium and calcium.

Salt Springs

Unnamed and undeveloped. Situated:

On the south side of Mokelumne River, some six miles south of Silver Lake, in Calaveras County.

In Inyo County, north of Inyo Range and east of Black Mountain.

In Trinity County, eighty miles from Red Bluff, on a branch of Strong Creek.

On the east side of Panamint Valley, in Inyo County.

In Tehama County, on Salt Creek.

On the east side of Death's Valley, in Inyo County, eight miles south of the bend of Furnace Creek.

Near the Armagosa Mines, in San Bernardino County.

In Alameda County, northeast of Patterson's Pass.

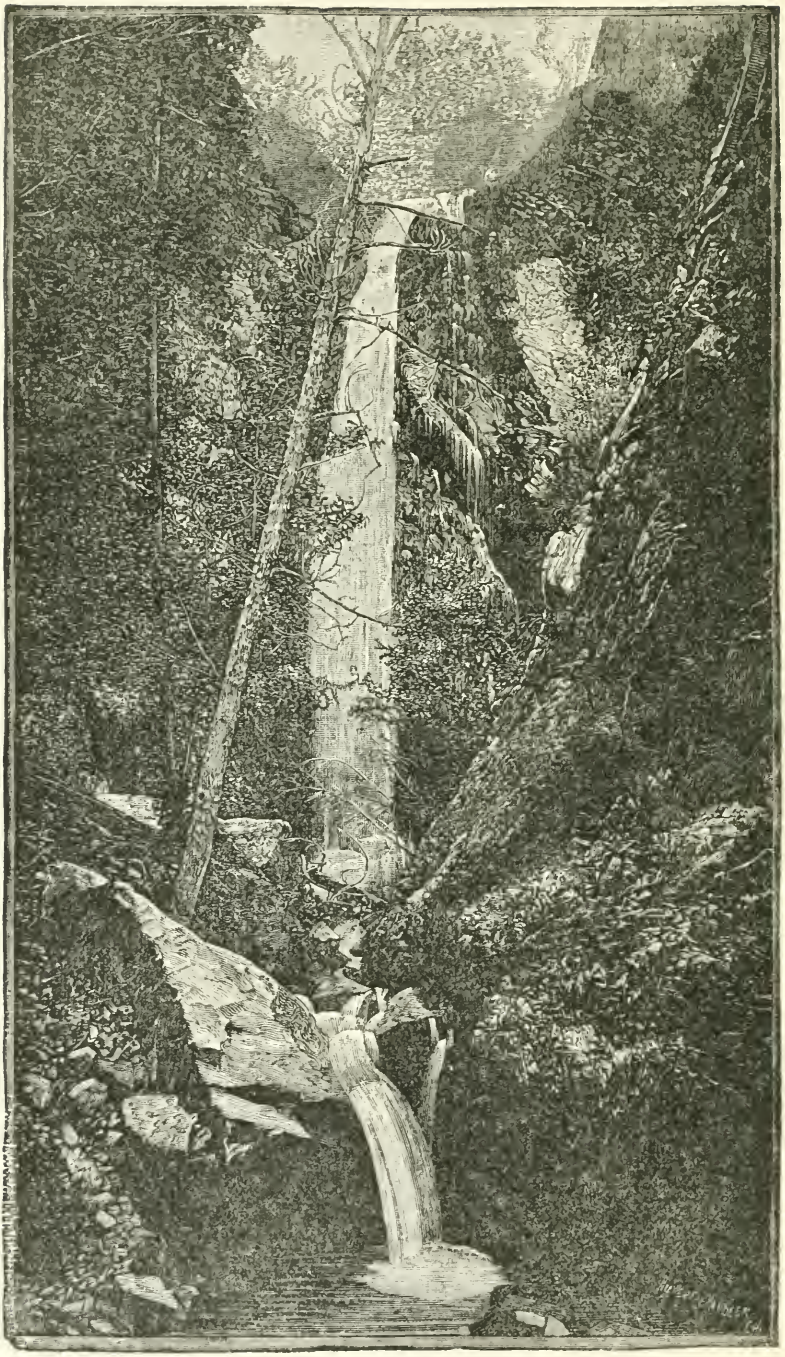
Salt Wells

In San Bernardino County there are a number of salt wells, located between Borax Flats and Indian Wells, in Salt Wells Valley. The waters are heavy, chlorinated and saline. A few are reported to be carbonated.

Salt deposits and salt mountains are numerous on this coast.

San Bernardino Hot Springs

These springs are located in San Bernardino mountains and county. Some confusion has arisen about the identity of these springs and the Arrowhead Hot Springs,



FALLS NEAR SAN BERNARDINO

in the same county. The Arrowhead Springs are situated some fourteen miles farther inland and at a greater altitude, over 2,000 feet, and near the mountain, with the space denoted "Arrowhead."

The San Bernardino Springs (altitude 1,600 feet) are hot, having a temperature of 100° F. and 175° F., and the waters are largely calcic and earthy. Like most springs they have acquired some local repute, and are used for drinking and bathing purposes.

SAN BERNARDINO HOT SPRINGS

CALCIC AND SALINE

Mineral Ingredients	*No. 1* Parts in 100,000	*No. 2* Parts in 100,000

Calcium Carbonate	10.70	11.00
Ferrous Carbonate	trace	trace
Silica	20.50	22.40
Total Solids	128.00	127.00

No. 1 is the large spring in front of the hotel, and No. 2 is the spring about two hundreds west of the hotel. The analyses were made by Oscar Loew.

San Juan Capistrano Springs

These springs are light carbonated and much used in the southern portion of the State. They lie in San Bernardino County, near Capistrano.

SAN JUAN CAPISTRANO SPRINGS

Mineral Ingredients	Parts in 100,000	Mineral Ingredients	Parts in 100,00

Potassium Carbonate	trace	Silica	7.66

Total Solids, 29.29

For cystic and renal troubles this water has been found beneficial. The above analysis was made by Oscar Loew in 1876.

San Marcos Sulphur Springs

These sulphur waters are found seven miles northwest of Santa Barbara, in the same county. They have a temperature of 120° F., and are used locally for skin diseases, etc.

San Juan Hot Springs

These springs, like the San Marcos, have attained some celebrity in the treatment of syphilis and cutaneous diseases. No analysis.

San Rafael Springs

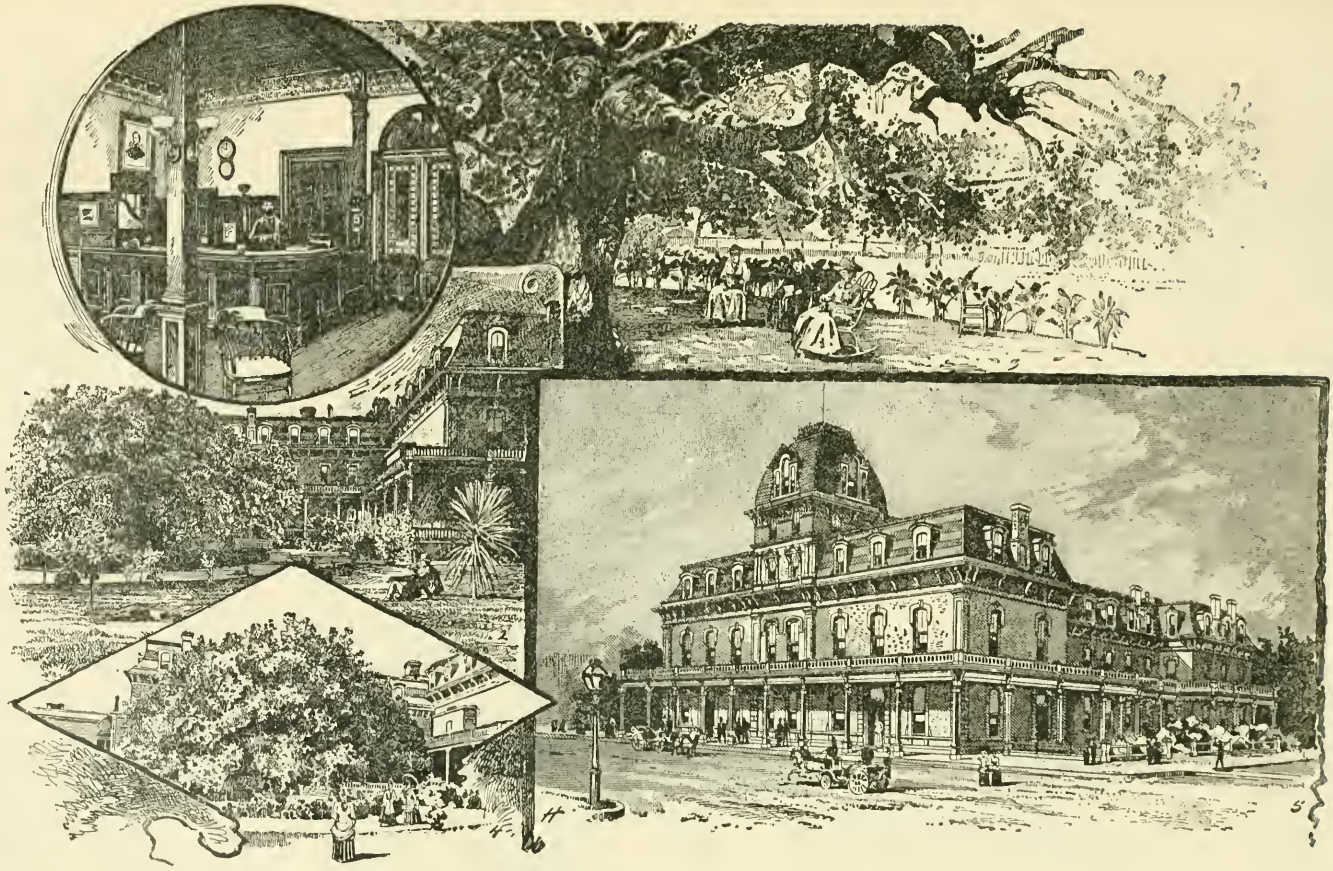
The water is slightly saline and carbonated, and used locally to a limited extent. The springs are situated near the town of San Rafael, in Marin County.

Santa Barbara Hot Springs

These famous hot sulphurous and soda springs are situated in the beautiful Santa Ynes Mountains, six and a half miles northeast of Santa Barbara city. The springs are picturesquely located amid the forest-covered mountains at an elevation of 1,450 feet above the sea level.

Excellent accommodations have been provided at the springs, and the resort is rapidly becoming celebrated.

On the premises we find some thirty mineral springs, some of which are sulphurous, others saline and chalybeate, ranging in temperature from 99° F. to 122° F. Seven of the principal springs are used for drinking and bathing purposes.



SAN MARCOS HOTEL AND GROUNDS AT SANTA BARBARA

On careful chemical analysis No. 1 and No. 2 and the Sulphur Spring yield:

SANTA BARBARA "SULPHUR SPRINGS"

These waters are of great value in the treatment of rheumatism, gout, joint affections, Bright's disease, liver trouble and bladder irritation. Being antacid, considerable benefit may be derived from the waters in dyspepsia and acid conditions of the blood and urine.

Perhaps the greatest benefit accrues from bathing in the sulphurous and saline waters, especially in syphilitic and scrofulous contaminations, glandular enlargements and chronic skin diseases.

At the time the country was under Spanish control a commission was sent out to report on these hot springs. The waters were highly recommended by them for many diseases, particularly skin diseases. Since that time thousands of visitors and invalids have used the waters with decided benefit.

Recently a large and commodious hotel and a spacious Pagoda bath-house, with stained glass and every modern facility, have been constructed.

It will be observed that the waters resemble much the famous Hot Springs in Arkansas. The resort is a growing one and deserves success.

Santa Rosa White Sulphur Springs and Resort

The Santa Rosa Springs are pleasantly situated about two miles from the town of Santa Rosa in Sonoma County. The surrounding country is delightful and the climate is beautiful. At the springs we find a growing resort; good accommodation and a well-kept and thriving place.

The springs flow in abundance, having waters of the light salino-sulphurous class. The waters are mostly sulphureted and cold, having temperatures from 59° F. to 62° F.

The principal spring is found to contain on analysis:

SANTA ROSA SPRINGS

LIGHT-SALINO-SULPHUROUS

Dr. Winslow Anderson, Analyst, 1886

Temperature 60.4° F.

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains

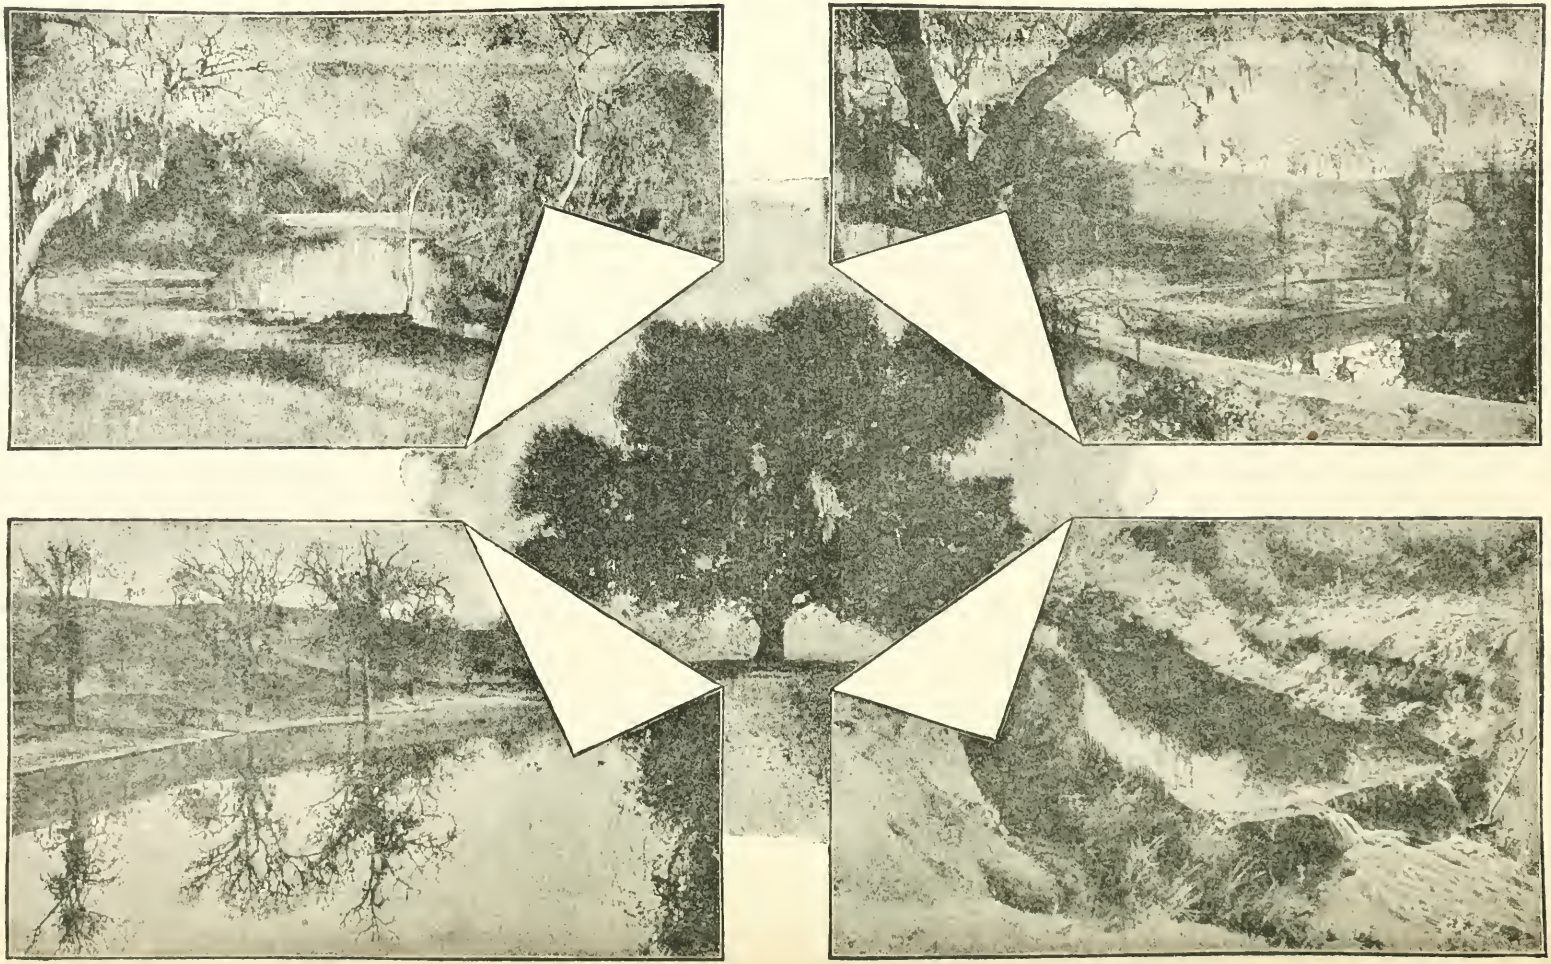
The action of this water is slightly aperient and diuretic, acting on the stomach, liver and intestinal tract. It is useful in congestion of the liver due to malarial poisoning and in rheumatism, kidney and bladder troubles, and skin diseases.

Excellent bathing facilities have recently been constructed, the water being artificially heated.

"Clear mirror of the region round!
Far curves thy rich, transparent green;
While memory, with thy beauties crowned,
Recalls thy every varied scene:

The hills that wave in graceful chain—
The shores of Nature's loveliest trace;
The homesteads isled in grass and grain,
Where peace hath found apparent place."



VIEWS OF YSABEL LAKE AND STREAM ABOVE IT, WITH LIVE-OAK TREE

Santa Ysabel Cold and Hot Sulphur Springs

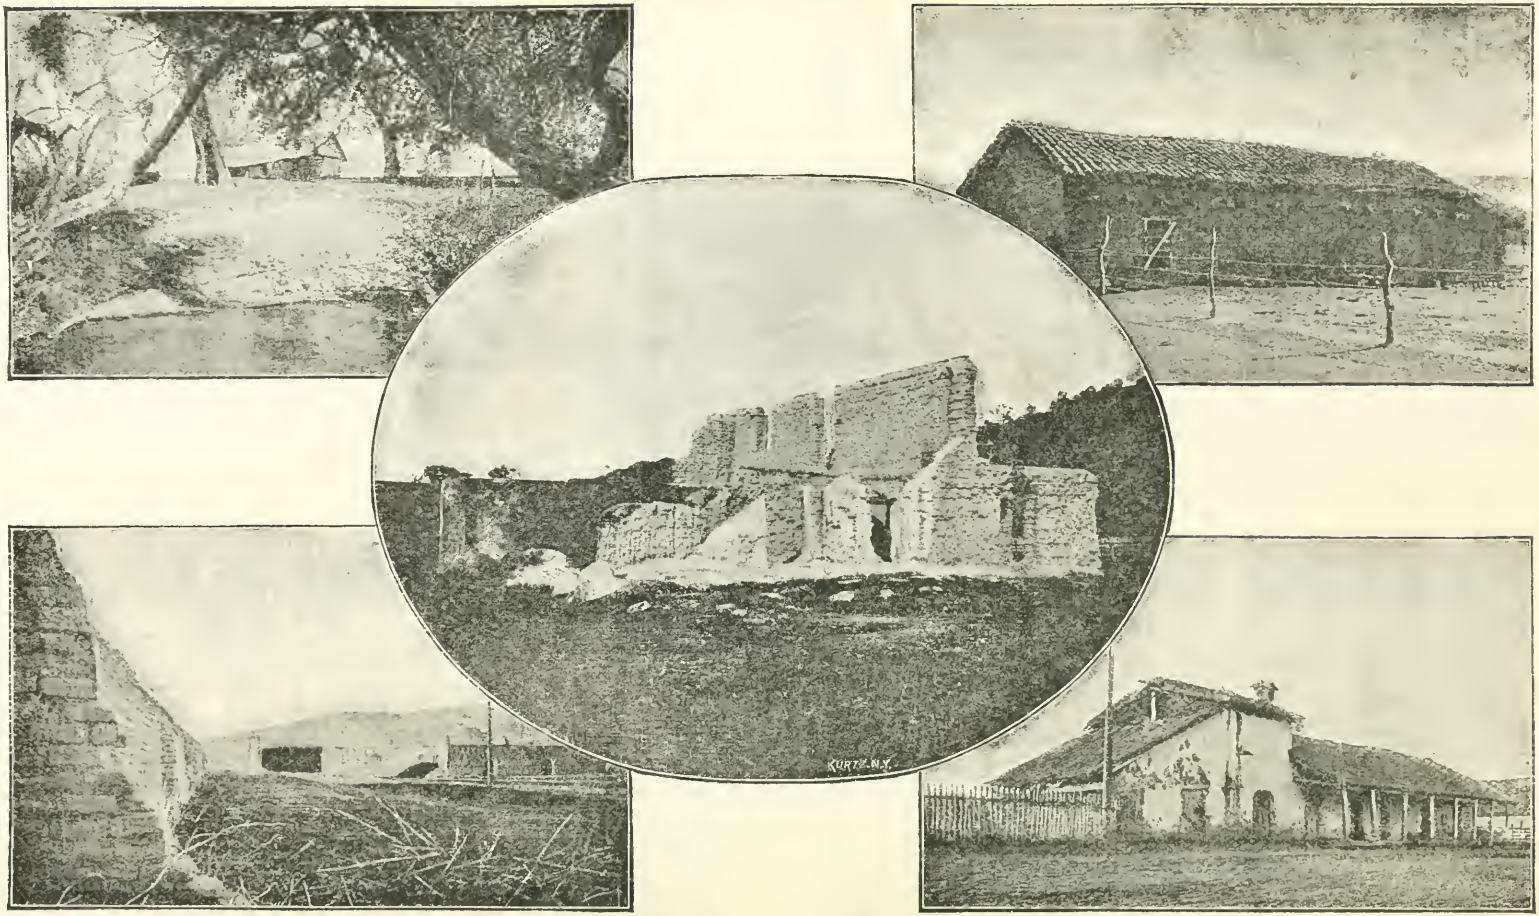
Several of the most valuable mineral springs in the State are located two and a half miles southeast of Paso Robles on the line of the Southern Pacific Railroad, and are known as the "Santa Ysabel Springs."

They are picturesquely situated in a small cañon about one mile east of the Salinas River. Surrounded on all sides are the rolling hills covered with groves of gigantic oaks, towering pines and clustering manzanitas, which shade the many cozy nooks and commanding outlooks on the premises. The hillsides are clad in luxuriant foliage, sweet scented shrubbery and a profusion of flowers of many hues, which are all pleasing to the eye and render the bright, pure and invigorating mountain air redolent with fragrance. As you sit at these yet undeveloped fountains, viewing the charming scenery and breathing the tonic ozonized mountain atmosphere, mixed with the sweet and fragrant aromas of the flora, the mountain stream glides along its silvered path amid fern laden, moss covered banks with here and there a rippling miniature cascade, and as the birds are chirping and singing their happy notes, a feeling of luxurious contentment fills your very soul and you regret you cannot remain forever in this paradise.

> "Not a cloud in all the sky,
> Save a few light fleeces,
> Which here and there, half mist, half air,
> Like foam on the ocean go floating by."

The climate belongs distinctively to that smiling sunny south where the air is balmy and the thermometer ranges from about 60° F. to 75° F. all the year around.

The springs themselves are located in the center of a large tract of land, at an elevation of 1,000 feet above the sea, and distant from the coast about thirty miles. The soil is unusually rich and fertile, producing every known variety of fruit as ascertained from the U. S. experimental station close by.



ADOBE BUILDINGS AT SANTA ISABEL AND VICINITY

The main warm sulphur spring, "No. 1" is situated near the side of the road in this beautiful little cañon. It is six feet long and four feet wide and flows the enormous amount of 20,000 gallons per hour. The waters are clear and sparkling, lightly sulphureted and freely carbonated, having a temperature of 96.3° F. Subjecting this spring to a careful chemical analysis, it is found to contain:

SANTA YSABEL WARM SULPHUR SPRING No. 1.

SALINO-SULPHURETED

Dr. Winslow Anderson, Analyst, 1886

Temperature 96.3° F.

Flows 20,000 gallons per hour

Mineral Ingredients	U. S. gal. contains Grains	Mineral Ingredients	U. S. gal. contains Grains

Magnesium Carbonate	6.16	Organic Matter	trace

Total Solids, 81.43

Gases	Cubic Inches
Free Sulphureted Hydrogen	4.65
Free Carbonic Acid Gas	11.75

From this analysis it will be observed that the water is very similar to the famous Arkansas Springs. For centuries this and the other springs have been used by the Indians and early Mexicans and Spanish settlers and Franciscan Fathers, who both drank and bathed in the water. Tradition tells us that they traveled hundreds of miles to reach the springs where marvelous cures were made; facts substantiated through the personal experience of the present inhabitants.

The waters are tonic, antacid, diuretic, aperient and alterative, acting on the organs of secretion and excretion, stimulating the process of eliminating the morbific and deleterious agencies of tissue metamorphosis, thereby purifying the blood and establishing healthy normal action of all the organs.

DRIVE ON BANK OF YSABEL LAKE

The hot sulphurous mud is excellent for bathing purposes, as indeed are the other warm sulphur springs. Extensive facilities for this purpose will be constructed in the near future and many cases of rheumatism, gout, glandular enlargements, chronic joint diseases and cutaneous affections may hope for much relief by prolonged bathing in these sulphurous water and mud baths.

About a quarter of a mile farther up the little cañon are located the cold or white sulphur springs. They bubble up in many places over an area of some several hundred feet. The temperature varies from 56° F. to 60° F. and the flow is not nearly so extensive as it is in the warm springs. The cold or white sulphur waters are also tonic, antacid, and alterative, and in a less marked degree laxative and diuretic. In other respects they resemble the warm sulphurous water, excepting that they are much lighter. The following analyses are of the two principal (Nos. 1 and 2) springs located near the road.

SANTA YSABEL SPRINGS

(Nos. 1 and 2 Cold or White Sulphur Springs)

LIGHT ALKANO-SULPHURETED

STREAM ABOVE YSABEL LAKE

From the mineral ingredients these hot and cold sulphurous waters exhibit on analysis, we pronounce them of great therapeutic value, especially in chronic rheumatism, chronic arthritis, scrofula and glandular enlargements and chronic cutaneous diseases. For torpidity of the liver and bowels, dyspepsia, and catarrhal affections of the kidneys and bladder, experience teaches us that this class of water promises much relief and assists materially the internal medication in effecting a cure.

Persons suffering with consumption, chronic bronchitis, asthma, catarrhal affections of the naso-pharynx, etc., may expect to do well in a climate so mild and exhilarating and by the use of the sulphurous steam and waters.

The mineral springs and surrounding country are owned by a San Francisco syndicate. Extensive improvements have already begun, good roads and building sites for hotels and cottages are laid out and a depot landing selected. A large mountain lake is in course of construction, which will be from 800 to 1,000 feet long by several hundred feet broad. On its waters will be several pleasure boats. About one hundred feet above it on a pleasant plateau, having a commanding view over the entire Salinas Valley, will be reared a large and commodious hotel, surrounding it will be built several cozy cottages for private and family use. Excellent facilities for hot sulphurous steam, water and mud bathing will be arranged at the principal springs. Within a short distance of the hotel will be convenient railroad facilities.

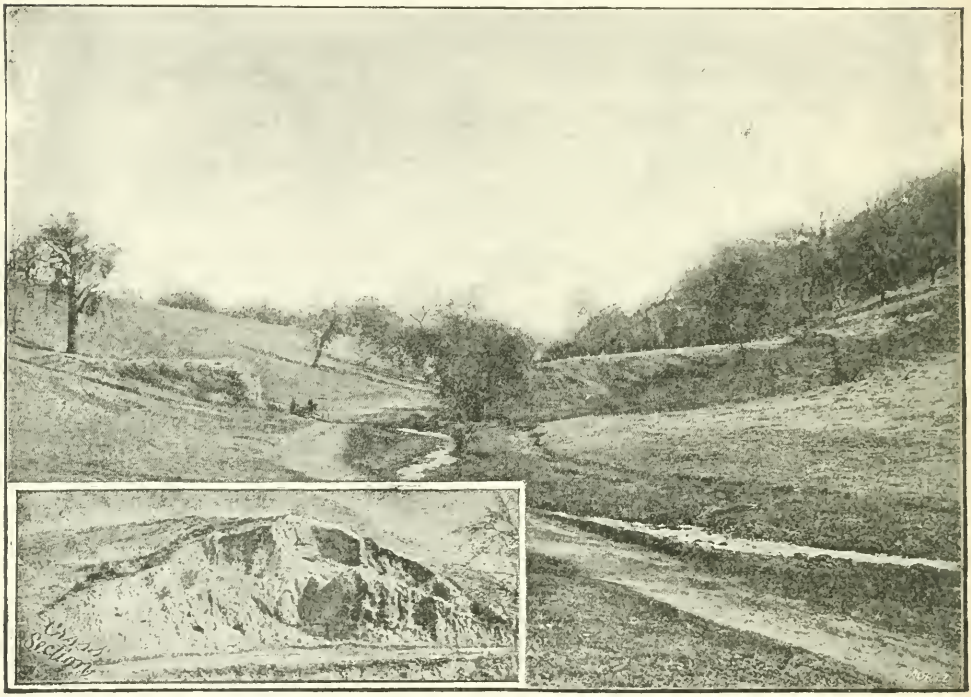
With the natural advantages of climate, soil and picturesque surroundings and the excellent mineral waters and pure mountain streams, Santa Ysabel Resort promises to be one of the pleasantest inland watering places in that section of the country.

The Santa Ysabel Resort will be under the patronage of the Presbyterian Church, a sufficient guarantee that it will be a well-kept and properly conducted place, where families

may be sent unattended with perfect safety. There will be no saloons or whisky-shops and the surroundings will be eminently proper.

Saratoga Springs

In Inyo County at the south end of Funeral Range and a little south of Death's Valley are located these pleasant springs. The immediate neighborhood of Funeral Range



REMAINS OF PREHISTORIC DAM WITH CROSS-SECTION

and Death's Valley need not detract from the resort which is in every way a good one and constantly growing in popularity.

Saratoga Mineral Springs

These Saratoga Springs are located in Lake County, about fourteen miles from Lakeport. The waters are cold

and contain sulphur, magnesia, soda and iron. There is a growing resort on the place, where visitors may enjoy the beautiful mountain scenery in the vicinity, as well as the water.

Seigler's Springs

These noted springs are located at the foot of Seigler Mountain at an elevation of 2,372 feet above the sea, in Lake County. They are near Adam's and Bonanza Springs. Seigler Springs lie in Seigler Valley, which is about one and a half miles long by half a mile in width. The surrounding country with the excellent drives afford magnificent views and recreation compared with the narrow limits of the ordinary city life. There are found twenty or more springs containing soda, magnesia, iron and arsenic. The flow approximates 3,000 gallons per hour.

The "Arsenic" Spring has a temperature of 96° F. and is much used for syphilis, scrofula and cutaneous diseases.

The Soda Spring is alkaline and carbonated and is a delicious drinking water. This has been used with much success in Bright's disease, bladder troubles, etc.

The Magnesia Spring is strongly charged with Epsom salt and carbonic acid gas. A glassful before breakfast insures an easy and painless evacuation.

The Sulphur Spring is mostly used for bathing and for lung, liver and rheumatic troubles.

Accommodations are good and one's time can be very pleasantly spent in this mountainous resort, where one feels freed from all the toils and cares of the world.

Shafer's Hot Springs

These springs are located in Lassen County at the north end of Henry Lake. The waters are thermal, having a temperature of 210° F. and contain salines and sulphates. There is a local resort.

SHAFER'S HOT SPRINGS

F. W. CLARKE, Analyst, 1883

SHASTA SODA

These soda springs are located on Shasta scenic route in Siskiyou County. They are carbonated and ferruginous and much prized by travelers.

SIMMON'S HOT SULPHUR SPRINGS

These sulphurous waters have gained more than a local reputation in the alleviation of chronic rheumatic troubles. They are located in Sulphur Cañon, near Wilbur Springs in Colusa County. The waters have a temperature of 170° F. and are highly charged with sulphureted hydrogen. Extensive improvements are reported.

SKAGGS' HOT SPRINGS

These excellent springs are located in Sonoma County, in the Coast Range, eight miles west of Clairville, twenty miles east of the coast and fourteen miles northwest of Healdsburg. The locality is picturesque and salubrious, surrounded by the many huge mountains covered with rich California verdure. The resort is of easy access by the S. F. & N. P. Railroad to Clairville and thence by stage eight miles. The comfort of the guests at the hotel is well looked after and everything is first class.

There are four principal springs at Skaggs', flowing about 1,000 gallons per hour. The waters are thermal,

alkalo-chalybeate having a temperature from 120° F. to 140° F. The main spring is located in the dry bed of Dry Creek, a tributary of Russian River. The water is agreeably pungent to the taste and clear and sparkling as it issues forth from mother earth.

Soda Bay

This natural curiosity is situated on the west shore of Clear Lake and consists of a large spring, several feet in diameter, from which a large quantity of water rises. It is so heavily charged with natural carbonic acid gas as to raise the waters as it bubbles up nearly a foot from the surface

of the water, giving the spring the appearance of active ebullition. The water is alkaline and stained with ferruginous salts. It also contains soda, lime and magnesia, etc.

Soda Lake

On the Mojave River and in the Saline Flats in San Bernardino County is located this saline and soda lake.

Summit Soda Springs

Near the summit of the Sierra Nevada Mountains are located these famous soda springs. They are of easy access by the Central Pacific Railway to Summit Station and thence by stage or carriage some twelve miles to the springs in Placer County.

The drive is a beautiful one, winding along through scenes of mighty grandeur, over mountains and down valleys, surrounded by lofty mountains covered with evergreen groves of pines and spruce and cedars and perpetually donned with snowy caps. Here and there are the deep ravines, covered with picturesque foliage, then mountainous peaks which seem to reach into the skies. Now we gain the summit and the magnificent view of the high Sierras is unobstructed for miles around. Here the imposing majesty of the Creator is felt in all His sublimity.

The springs themselves (see illustration) are located in an expansion at the head of the deep cañon along which winds one of the forks of the American River. The surroundings are exceedingly picturesque. The air is pure, dry and invigorating, and cool and pleasant during the heated Summer season. The altitude is 6,009 feet above the level of the sea—an excellent place for persons suffering with bronchial, catarrhal and asthmatic affections.

At the springs the accommodations at the hotel and cottages are superior—bathing facilities have been added, and everything is convenient and pleasant.

The hills are well stocked with wild game and the rivers are filled with mountain trout, affording all the sport with the gun and rod that may be desired.

For a man worn out with the mental strain of business cares who seeks rest for his brain and invigorating exercises for his body, no more delightful place than Summit Soda Springs and health resort can be found.

On analysis the Summit Soda yields:

SUMMIT SODA SPRING

The water is antacid, diuretic, aperient and tonic; most excellent in the treatment of dyspepsia, torpidity of liver and bowels, Bright's disease, irritation and stone in bladder, etc.

Comparative Table of Analyses of the different drinking waters used in some of the larger cities in America, including Lake Tahoe's waters:

ANALYSES DRINKING WATERS

Total Solid Ingredients	U. S. gal. contains Grains	Total Solid Ingredients	U. S. gal. contains Grains
Lake Tahoe	3.00	Detroit River (Detroit)	5.72
Lake Cochituate (Boston)	3.37	Ohio River (Cincinnati)	6.74
Mill River (New Haven)	4.00	Hudson River (Albany)	7.24
Lake Ontario, (Rochester)	4.16	Lake Michigan (Chicago)	8.01
Jamaica Pond { Brookline. Boston }	4.40	Croton River (N. Y. City)	10.60
Schuylkill River (Phila.)	5.50	Spring Valley Water (S. F.)	11.20

This shows that Lake Tahoe is the purest and best water available in America for drinking purposes and that Spring Valley water is the worst in use in any large city. Let us have water from Lake Tahoe by all means.

GENERAL VIEW OF LAKE TAHOE—BY THOMAS MORAN

Lake Tahoe

My soul bowed down in wondering humble awe,
When first thy peaks and waterfalls I saw ;
And every hour but shows how vain 'twould be
For my frail mind to hope to picture thee.
Thy spell shall live and those who view thee now
Have passed with ages 'neath thy mighty brow,
And like thy mists, in gorgeous gleamings curled,
Our names have melted from this changing world.

—*Mrs. Jean Bruce Washburn*

Tahoe Springs on Lake Tahoe

These are located near the State line. They are described under the head of Lake Tahoe or Carnelian Springs.

Lake Tahoe itself is a magnificent sheet of water located most picturesquely among the snow-capped Sierras at an elevation of 6,250 feet. It is about 20 miles long and 12 miles wide and has an average depth of 1,500 feet. Lake Tahoe's water is exceptionally pure. On analysis it is found that one gallon does not yield more than three grains of solids, whereas Spring Valley in San Francisco shows over nine grains of foreign matter to the gallon. It is hoped that the day may come when we shall enjoy "Tahoe's" pure water for drinking purposes in San Francisco.

Temescal Hot Springs

Located in San Diego County. Used locally.

Tassajara Hot Springs

At the head of Arroyo Seco, in Monterey County, are located these hot saline and sulphurous waters. The Spanish and the aborigines in the vicinity frequented these springs for many years and were apparently much benefited. No analysis; used locally.

Thermal Acid Springs

These remarkable springs are found in the Caso Range, twelve miles east of Little Owen's Lake and sixteen miles southeast of Olamoha, in Inyo County.

The country for miles around the springs is rich in pure crystallized sulphur, having no doubt been ejected by the sulphurous laden steam in the form of sulphurous anhydride (SO_2). On being exposed to the atmosphere and surrounding products of sulphureted hydrogen (H_2S), the sulphur was deposited pure and water liberated.

$$SO_2 + 2H_2S = 2H_2O + 3S.$$

This is probably the explanation of the formation of these large sulphur banks.

The water now flows through the small crevices and fissures accompanied by sulphurous steam and vapors in rather limited quantities.

On analysis the waters are found to contain:

THERMAL ACID SPRINGS

Unknown Analyst

Mineral Ingredients	Parts per 1,000	Mineral Ingredients	Parts per 1,000
Sodium Sulphate	2.5	Sulphuric Acid	78.4
Potassium Sulphate	15.1	Nitric Acid	trace
Magnesium Sulphate	15.3	Chlorine	trace
Calcium Sulphate	1.2	Ammonia	trace
Aluminium Sulphate	127.0	Lithium	trace
Ferric Sulphate	33.2		

	Parts
Total Solids	272.7
Water pure	727.3
Total	1,000.0

This water is not much used as far as the writer can learn, nor does he know to whom to give credit for the above analysis. Well diluted and properly administered this acid sulphate water ought to be valuable in many conditions requiring tonic and astringent remedies.

The sulphur banks will also prove of commercial value in time.

Thermal Springs

Unnamed and unimproved. Located *on Battle Creek* some five miles above Morgan's Ranch in Plumas County.

In Inyo County, opposite Black Rock, on Owen's River.

Near the mines of Darwin in Inyo County.

Ten miles east of Telescope Peak in Inyo County.

Tolenas Springs

These noted springs are located about five miles north of the town of Suisun in Solano County, adjoining the famous Tolenas onyx quarries on the Tolenas or Armijo's Rancho. They are easily reached by rail from San Francisco or Sacramento to Suisun and then by easy stage over a good level road.

The resort is at an elevation of 1,235 feet and is pleasantly located. The view from the springs is quite extensive. On a clear day the State capital, Suisun Bay and Valley, Gordon, Wooden, Elmira, etc., may easily be seen. There are nineteen springs in all at Tolenas, flowing between six hundred and seven hundred gallons per hour. The temperature varies from 60° F. to 65° F.

TOLENAS

ALKALO-SALINE AND CHLORINATED

	Dr. Winslow Anderson Analyst, 1888 *Temperature 61.5° F.* U. S. gal. contains	J. Hewston, Jr. Analyst U. S. gal. contains
Mineral Ingredients	Grains	Grains
Sodium Chloride	194.16	215.92
Sodium Carbonate	46.93	53.36
Sodium Bicarbonate	6.45	—

Free Carbonic Acid Gas	31.27	33.73

These springs have had a local reputation for over thirty years and of late the water has been bottled and sold extensively all over the State. The resort is also in a flourishing condition, which indicates public appreciation.

The water is indorsed by many who have used it. In chronic skin affections, eczema, scrofula, and syphilitic contaminations the water seems to do well. Chronic gastric disturbances, kidney and bladder diseases improve under the use of the Tolenas Soda. The water is gently aperient and strongly diuretic.

Tule River Soda Springs

On the south fork of the Tule River a little east of Porterville in Tulare County lie a number of cold soda springs. The waters are much used locally and a resort is contemplated. No analysis at present.

Tuscan or Lick Springs

These springs are located about nine miles northwest of Red Bluff on the Sacramento River in Tehama County. They are reached by stage from Red Bluff.

The springs lie in the center of a rough and rugged country showing signs of extinct volcanic action, at an elevation of about six hundred feet. In this volcanic region of Tuscan are upwards of one hundred springs. Three only are in active use and are known as the "Red" Spring, the "White" Spring and the "Black" Spring. The "Red" Spring was analyzed by Dr. F. W. Hatch several years ago, and contains:

Tuscan Red Springs

Temperature 78° F. to 80° F.

Sulphuric Acid	Carbonic Acid
Hydrochloric Acid	Bicarbonate of Iron
Lime	Potassium Chloride
Sodium Chloride	Magnesia
Lithia	Alumina

Iodine

The "White" and the "Black" have not been analyzed. The waters are saline and sulphurous and have proved efficacious in rheumatism, constitutional syphilis, glandular disorders, etc. The waters resemble somewhat the famous Blue Lick Springs of Kentucky.

They act as a diuretic in small quantities and laxative in larger ones. Excellent bathing facilities have been arranged for hot and cold baths and many people make pilgrimages yearly to this volcanic resort.

The waters cannot be analyzed in time for issuance in this work.

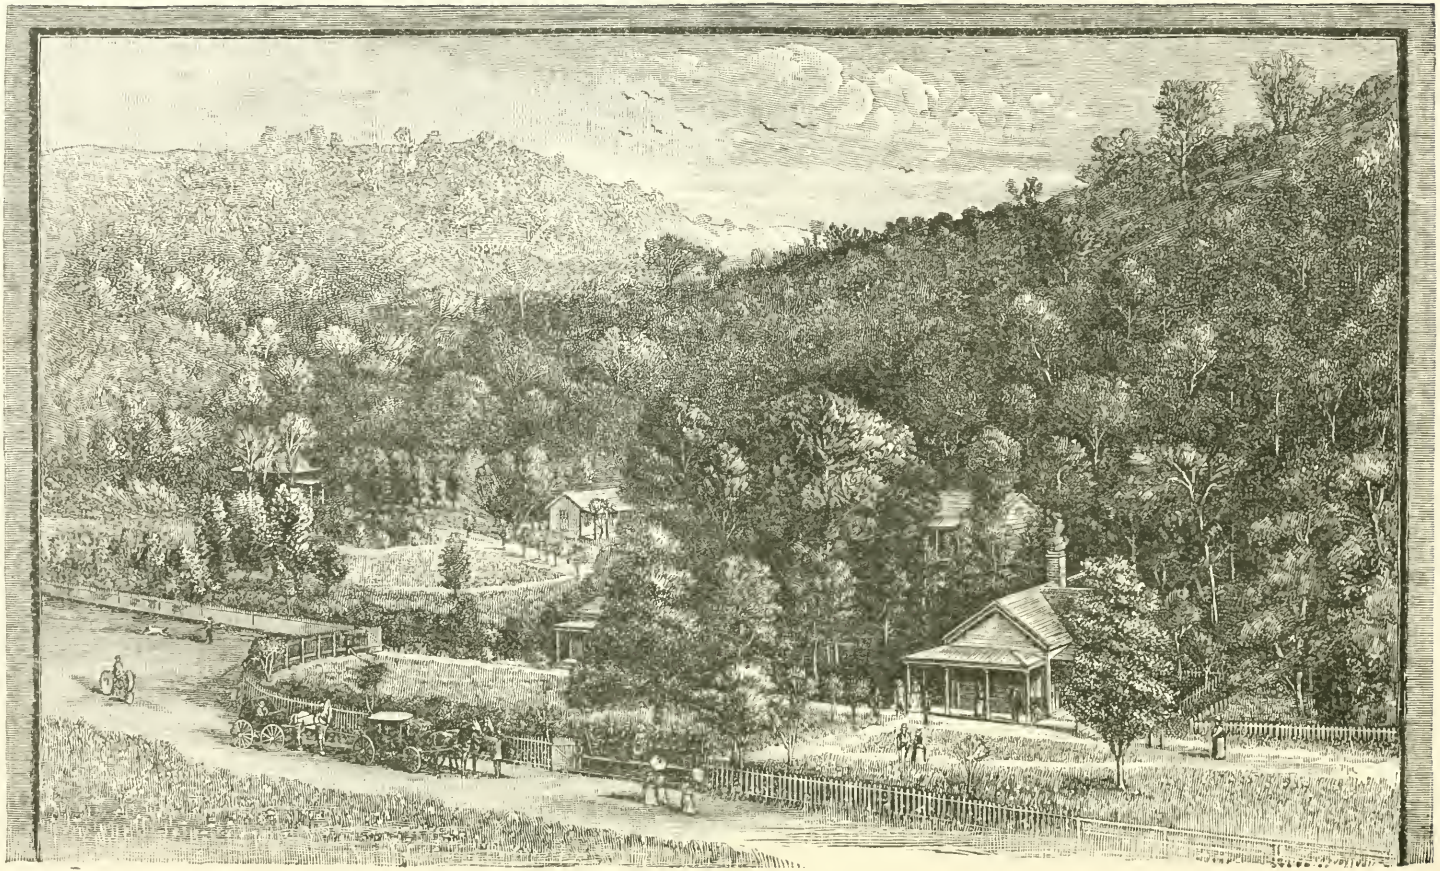
Doolan's Ukiah Vichy Springs and Health Resort

About thirty-two miles from Cloverdale and three short miles from Ukiah, county seat of Mendocino, are located the Doolan Vichy Springs. They lie nestled among the enchanting hills which fringe the boundary line of Lake and Mendocino counties. They were formerly reached by a drive from Cloverdale or Calistoga, but now the springs are of much more easy access by the picturesque and interesting route of the new San Francisco and North Pacific Railroad which runs to Ukiah.

Nature could not have done more for this natural sanitarium than it has. From April to November the climate is delightfully balmy and the atmosphere is pure, clear and invigorating. In the immediate vicinity are excellent fishing and gunning. The resort is rapidly growing and commodious accommodations can be found. Bathing facilities are claimed to be superior. The waters are gaining in celebrity in cases of gout, rheumatism, scrofula and chronic kidney and bladder troubles and cutaneous diseases.

Bathing in the Vichy renders the skin soft and clear and very soon heals up any skin irritation.

The waters belong to the alkalo-carbonated class and are clear and sparkling and of an agreeably pungent taste.



DOOLAN'S UKIAH VICHY SPRINGS

Their action is almost identical, as indeed is their chemical composition, with the noted Ems on the Lahn; Fachingen of Nassau, Germany; and Vichy of Grande Grille, France.

From the following chemical analysis, made in 1888, it will be observed that the waters from the Doolan Vichy are heavily charged with carbonic acid gas and carbonates and that they contain some iron and potassium salts.

For an antacid, tonic, aperient, diuretic and alterative mineral water the Ukiah Vichy ranks among the finest on the Coast. They have proved highly beneficial in Bright's disease, torpidity of the bowels and liver. For dyspepsia and acid conditions of the urine and the blood they are excellent.

The waters are soon to be sold commercially.

Owing to recent developments the flow has increased enormously, flowing now about 20,000 gallons per hour.

On the premises are numerous springs which will soon be developed and analyzed.

Upper Soda Springs

These excellent mineral springs are situated at an elevation of 2,363 feet, in Siskiyou County on the Shasta scenic route of the Southern Pacific Railroad. They are beautifully surrounded by the almost precipitous walls of the Sacramento Cañon, mountain streams and immense forests of pine, fir, spruce, cedar, etc., and some of the grandest scenery in the Sierras. Ever watching is Mt. Shasta, with its snow-capped apex and bountifully fertile base. Here and there are the enormous granite shafts, rising hundreds of feet into the atmosphere. The projecting rocks and huge boulders seemingly almost ready to fall and dash headlong down the cañon.

At the springs is a very quiet, commodious, comfortable, good, old-fashioned hotel with large airy verandas. Plenty of room for everybody both inside and outside.

The mineral water belongs to the Alkalo-carbonated or *soda* class, sparkling and effervescing, exceedingly palatable and wholesome.

It contains chlorides of soda and potassa, carbonates and bicarbonates of soda, magnesia, potassa, iron, lime, manganese, sulphates of soda and magnesia (Glauber's and Epsom salts) and a large quantity of free carbonic acid gas.

These springs have become famous in the treatment of uric acid and lithic acid diatheses, gravel and calculi, inflammation and irritation of the bladder and kidney, etc.

The water acts as an aperient, diuretic, tonic and anticid, and is of great value in acid conditions of the stomach, blood or urinary secretions.

Vallejo Sulphur Springs

Near Vallejo in Solano County are located several sulphur springs, which are used considerably, locally. The temperature ranges from 80° F. to 90° F. The waters act well on torpid portal circulation.

Volcanic Mineral Springs

In Death's Valley, Inyo County, are located several remarkable springs. One of these was analyzed by Prof. Price several years ago and found to contain over 4,000 grains of solids in a gallon. The water is chlorinated and alkaline, containing, presumably, both sulphureted hydrogen and carbonic acid gas.

Total Solids, parts 92.1

In Inyo County, nine miles from Amargosa mines.

In Lassen County, southwest of Pittville.

These springs, and many others of which I cannot obtain any reliable information, are warm and sulphurous in character. A few are reported calcic and alkaline. Their temperature varies from 85° to 132° F.

WARM SULPHUR SPRINGS

In Kern County on Posa Creek, near Simmis Valley, are found a number of warm springs, with temperatures from 74° to 90° F. The waters are used locally for rheumatism and cutaneous affections.

WARNER'S RANCH SPRINGS

These are situated some thirty miles from San Diego in San Diego County. These springs are also spoken of as Aguas Calientes by the Spanish, although not identical with the Aguas Calientess described under that head.

The flow of Warner's Springs is about 1,500 gallons per hour. The temperature is from 74° to 142° F. The waters are sulphurous and saline and much resorted to by the inhabitants of that section of the country. Their great reputation is the treatment of syphilis and chronic skin diseases. A pleasant little resort has been established on the place and a great many people go there to bathe and drink the waters.

Waterman's Springs

These mineral springs are located about a mile west of Arrowhead in San Bernardino County. They are the private property of Mr. Waterman, who prizes them highly. A description for publication is not obtainable.

White Sulphur Springs

These excellent springs and resort are located about two and a half miles south of St. Helena in Napa County. They are of easy access by ferry and rail via Napa City to St. Helena and thence by carriage. The resort is well-kept, commodious and pleasant. The grounds are handsomely laid out and ornamented with shrubbery and evergreens, orchards and flowers.

The White Sulphur comprise nine springs with temperatures from 69° F. to 142° F. The waters are light, sulphureted and alkaline and are much extolled by a great many who have used them. They seem very well adapted to the treatment of rheumatism and joint complications both by way of bathing and for internal use; also for congestion and inaction of the chylo-poetic viscera, glandular swellings and cutaneous affections.

ANALYSES WHITE SULPHUR SPRINGS.

WHITE SULPHUR SPRINGS.

Located *in Amador County*, two miles north of Plymouth.

In Inyo County, at the edge of Panamint Range, 12 miles north of Panamint.

In the town of Santa Rosa, in Sonoma County, used locally.

In Tehama County, southwest of Red Bluff, in Bear Gulch.

These waters are heavy and light, salino-sulphurous and sulphureted. Some are reported to have large excess of sulphureted hydrogen and others both carbonic acid gas and sulphureted hydrogen.

In Santa Rosa the water is used by most of the inhabitants for bathing, facilities having been constructed for

hot steam, hot tub and plunge baths. It is observed that these hot sulphur baths are excellent for incipent colds and rheumatism and in many cases of chronic rheumatic troubles.

Wilbur Springs.

These mineral springs are located thirty miles from Colusa in Colusa County. They are pleasantly situated and have acquired considerable reputation from their therapeutic properties. At the springs are good accommodations in the hotel and cottages and excellent camping facilities. The resort is reached by railroad to Williams and thence by stage. The waters are hot and sulphureted, containing:

WILBUR SPRINGS

Witter's Mineral Springs.

These mineral springs are pleasantly located in Lake County, about one mile east of Pearson's Springs, five miles from Upper Lake and three miles from Blue Lake.

The resort—a growing one—is picturesquely located, having good views of the lakes, valleys and mountains in the vicinity.

The resort comprises a good commodious hotel, several cottages and excellent bathing facilities for hot and cold mineral baths.

The springs are all cold and flow about sixty gallons per hour. They are at an elevation of 1,800 feet. There are cold soda and iron springs and cold sulphur springs. The principal water is known by the very emphatic if not euphonious name of "Dead Shot," having reference to the action of the water on the diseases for which it is recommended. These are: liver and kidney diseases and bowel disorders. The water contains:

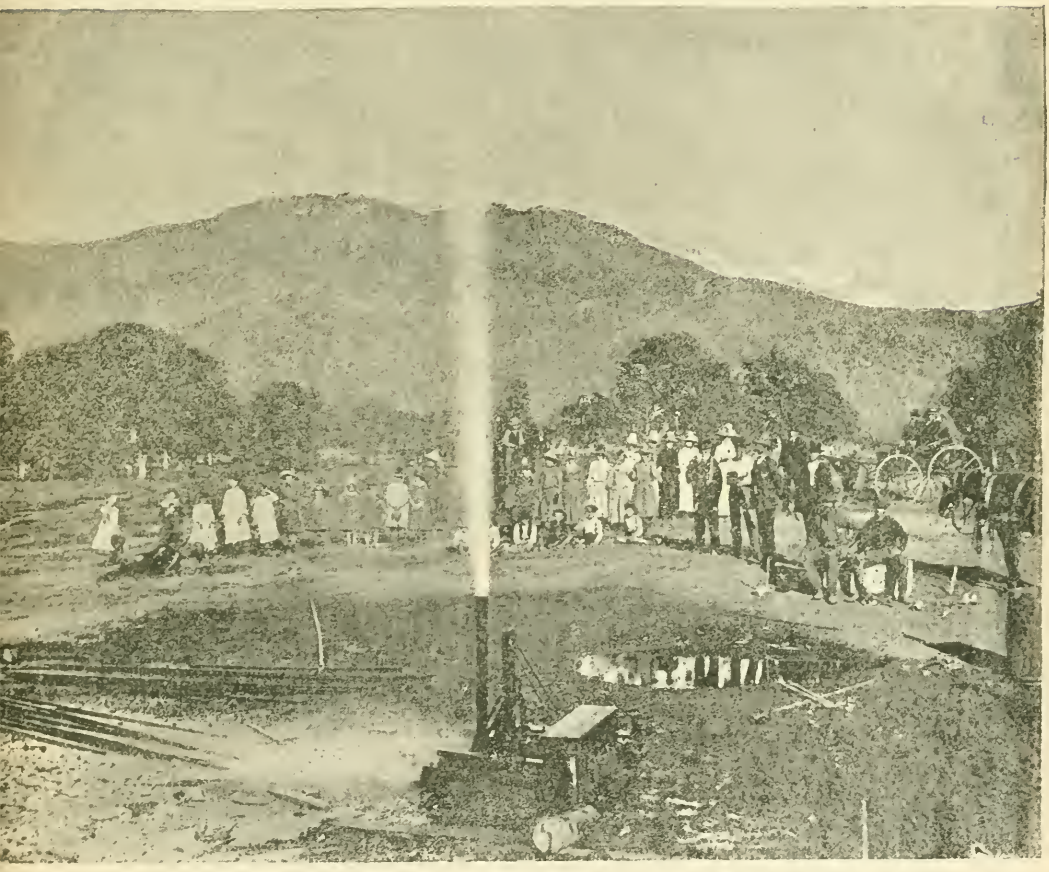
YOUNG'S NATURAL GAS WELL AND MINERAL SPRINGS

These natural wonders are on the property of Mr W. G. Young and are located on the eastern edge of Kelseyville, on a little elevated ground about three miles south of Clear Lake. The surroundings are picturesque, lying, as they do, just within the lower extremity of Big Valley and near the base of "Uncle Sam" Mountain. The country is fertile and the land valuable, being among the best in Lake County. The climate of Lake County is noted the world over for its salubriousness, the air being mild, dry and balmy.

The elevation at the gas well is about 1,500 feet, giving a commanding view to the surrounding country; and well may Lake County be called the "Switzerland of America,"

for a more picturesque view could not be found than that of Clear Lake, lying in the embrace of the surrounding mountains peacefully smiling on the outstretched and prolific valley with its gigantic oaks, the largest in the State, and old Uncle Sam, like an ancient guardian, watching the beautiful landscape.



GAS WELL AT KELSEYVILLE ON THE PROPERTY OF W. G. YOUNG
From a Photograph by G. E. Moore, Lakeport

In 1888 Mr Young bored a well for gas. When down about one hundred and fifty-eight feet a large volume of water and gas rushed out with considerable force. The well is now ejecting, and has been so continuing from the time

it was bored, a large stream of mineral water and gas, which rises into the air to a height of about forty feet, from seventy to eighty times every minute. For a moment it stops and then comes another violent ejection in a true Geyser style. The flow is about 6,000 gallons per hour and the water has a temperature of 76° F.

Within a year it is estimated that over 5,000 people visited this natural wonder, the only one in the State of its kind. The water has been extensively used by the inhabitants of Kelseyville and surroundings, who pronounce it excellent for the liver, kidney and bowels.

YOUNG'S GAS WELL

Free Carbonic Acid Gas	9.60
Petroleum and Carburetted Hydrogen (inflammable gas)	traces

This water contains all the elements to make it valuable therapeutically. Its action is tonic and anticid, of great value in dyspepsia; it is aperient or laxative according to the amount taken, acting on the liver and bowels; it is also diuretic from the carbonates and would be of value in Bright's disease of the kidneys, inflammation of the bladder, in acid conditions of the urine, etc., etc. We understand that the owner contemplates erecting a first-class health and pleasure resort on the premises. Bathing facilities would

also be of considerable importance, as the water, heated, would be very useful for rheumatism, chronic joint diseases, white swellings, scrofula and chronic cutaneous diseases, and glandular enlargements.

Several inflammable gas wells are also found on the grounds—(see article in book, "Inflammable Natural Gas"). One of these is about fifty feet west of the spring, and during our visit in 1888 the gas was ignited and burned with a pale blue flame and yellow tips, giving forth empyreumatic odors, probably due to the incomplete oxidation of the carbon products. This can easily be remedied by using suitable burners. The gas is largely light carburetted hydrogen (CH_4) and of considerable value in an economic point of view as the whole of Kelseyville and a large resort besides could easily be lighted and heated by the natural product from Nature's chemical laboratory.

Several other minor gas wells are also found on the premises and it is contemplated to utilize this valuable product.

Zem Zem Springs

(meaning "Holy Well in Mecca")

These mineral springs are located on the southeastern side of Clear Lake, in Lake County. The waters have a temperature of 64° F., and contain:

Soda, alumina, magnesia, silica, etc. The waters are highly carbonated.

There is a small resort at the springs.

For dyspepsia and kidney diseases the waters seem to be beneficial. For rheumatism and diseases of the liver, the springs have some notoriety. Analysis said to have been made by Dr. Boon.

Sulphur	50 parts in 1,000
Iron	27 parts in 1,000
Magnesia	28 parts in 1,000
Solid Matter	105 parts in 1,000

"Tired of its own bright charms, the golden day
Rests in the arms of evening; all is still;
Nor leaf, nor flower moves, lest the spell might break
Which holds the Earth bound fast in twilight chains.
From yonder hawthorn tree some leaf-hid bird
Breathes to the dying day a soft farewell,
That, mingling with the stillness, seems to weave
Into the silence threads of melody.
Wild roses, since the dawn, have deeply blushed
Beneath the sun's warm kisses; now at Eve
Faint odors, passing sweet, possess the air—
Rich incense offered to the Queen of Night!
For lo! a silvery light falls all around,
As up the violet heavens a pale young moon
Climbs high and higher still.
A low-voiced breeze,
Rising with balmy sigh amid the hills,
Comes ling'ringly adown the rocky glen,
Floats o'er the uplands, kisses every flower,
And whispers that the fair, sweet Day is dead!
Now restful thoughts and calm enter the heart,
And soothe the tired brain; as from on High
A blessing falls on everything below:
Cool shades to Evening—rest and peace to Man."

The following analytical tables of all the important mineral waters in the world are arranged alphabetically, commencing with those of Oregon, Western States, Southern and Southwestern States, Virginia, Pennsylvania, New York, New England and lastly the European mineral springs,numbering in all about two hundred.

California

"Pious Portala, journeying by land,
Reared high across upon the heathen strand,
Then far away
Dragged his slow caravan to Monterey.

The mountains whispered to the valleys, 'Good'
The sun, slow sinking in the western flood,
Baptized in blood
The holy standard of the Brotherhood.

The timid fog crept in across the sea,
Drew near, embraced it and streamed far and free,
Saying 'O ye
Gentiles and Heathen, this is truly He.'

All this the Heathen saw; and when once more
The holy Fathers touched the lovely shore–
Then covered o'er
With shells and gifts the cross their witness bore."

Bret Harte.

Origin of the Name of California.

Many hypotheses have been advanced relative to the origin of the name of California.

Some writers favor the theory that the word is of aboriginal origin depending on some misunderstood words of the natives. Several writers among the Jesuit Missionaries point out the possibility of the word being derived from the Latin Calida fornax (hot furnace), as the southern part of Lower California was first touched by the discoverers during the hot season. Other less reasonable

conjectures regarding the origin of the name have been found, until the noted antiquarian, Edward Everett Hale, promulgated, April 30, 1862, through the American Antiquarian Society the most authentic as well as the most probable account of the first use of the name California as follows:

There lived in Seville a favored Spanish novelist, Ordonez de Montalvo, who published a romance in 1510 entitled "Las Sergas del esforzado caballero Esplandian," in which the name appears twice as will be seen by the following translation. The romance was very popular and rapidly passed through several editions from 1510 to 1526. One of these issued from Madrid in 1521 is used for the translation.

TRANSLATION

The exploits of the very valiant Knight Esplandian, son of the excellent King Amadis of Gaul.—[Madrid, 1521.]

Furnished by Prof. Henry G. Hanks, State Mineralogist of California, in his sixth Annual Report, 1886.

Translated by Mr. Camilo Martin, Consul for Spain.

Chapter CLVII

The marvelous and not thought of succor with which the Queen Calafia came to the Port of Constantinople in favor of the Turks.

I wish you now to know a thing the most strange which ever either in writing or in people's memory could be found, by which the city was the following day on the point of being lost, and how from there where the danger came, salvation came to it. Know then that to the right hand of the Indies, there was an island called California, very near the part of the terrestrial Paradise, and which

was inhabited by black women, without there being among them even one man, that their style of living was almost like that of the Amazons. They were of robust bodies and valiant and ardent hearts and of great strength; the island itself was the strongest that could be found in the world through its steep and wild rocks; their arms were all of gold and also the harness of the wild beasts on which they rode after taming them, as there was no other metal in the whole island; they dwelled in well-finished caves; they had many ships in which they went to other parts to obtain booty, and the men whom they made prisoners they took along, killing them in the way you shall hear further on. And sometimes, when they were at peace with their adversaries, they used to mingle with them with entire confidence; if any of them gave birth to a son, he was put to death at once. The reason for it, as it was known, was because in their thoughts they were resolved to lessen the men to so small a number that they would be able to master them without much trouble, with all their lands, and preserve those who would understand that it was convenient to do so that the race might not perish.

In this island, called California, there were a great many griffins, the like, on account of the ruggedness of the land and the very many wild beasts therein contained, were not found in any other part of the world; and when they had little ones these women would go covered with thick skins to catch them by tricks, and they would bring them to their caves and there rear them; and when they were accustomed to them, they would feed them with those men and with the male children they bore, so often and with such cunning that they very well learned to know them, and never did them any harm. Any man who landed on the island was at once killed and eaten by them; and though they might be glutted, they would not the less take them and lift them up, flying through the air, and when tired of carrying them, they would let them fall, where they would be killed

at once. Well, at the time when those great men of the pagans departed with those large fleets, as history has already told you, there reigned in said Island California, a queen very tall of stature, very handsome for one of them, of blooming age, desiring in her thoughts to do great deeds, valiant in spirit, and in cunning of her fearless heart, more so than any of the others that before her reigned in that seigniory. And having heard how the greatest part of the world was moving in that expedition against the Christians, she, not knowing what beings were the Christians, nor having any knowledge of other countries except those which were next to hers, wishing to see the world and its different races, thinking that with her great valor and that of her adherents all that would be gained she would have, by force or by cunning, the largest share of, she spoke with all those that were skilful in war, telling them that it would be well that, going in their great fleets, they should follow the same road that those great princes and eminent men were taking, inciting and encouraging them by laying before them the very great honor and gain that might result to them from that undertaking; above all, the great fame that would resound in the whole world about them; that remaining in the island as they were, doing nothing but what their ancestors had done, would be only to be buried in life, like living dead, passing their days without fame and without glory, like wild animals.

So many things said to them by that very valiant Queen Calafia, that she not only moved her people to consent to the undertaking, but they, with their great desire that their fame should be published in many parts, hurried her to put to sea at once, so as to happen to be in the danger jointly with those great men. The Queen, who saw the determination of her people, ordered her great fleet to be supplied with provisions, and with arms all of gold and with all other necessaries; and she ordered the repairing of her largest vessel, made like a grate of thick timbers,

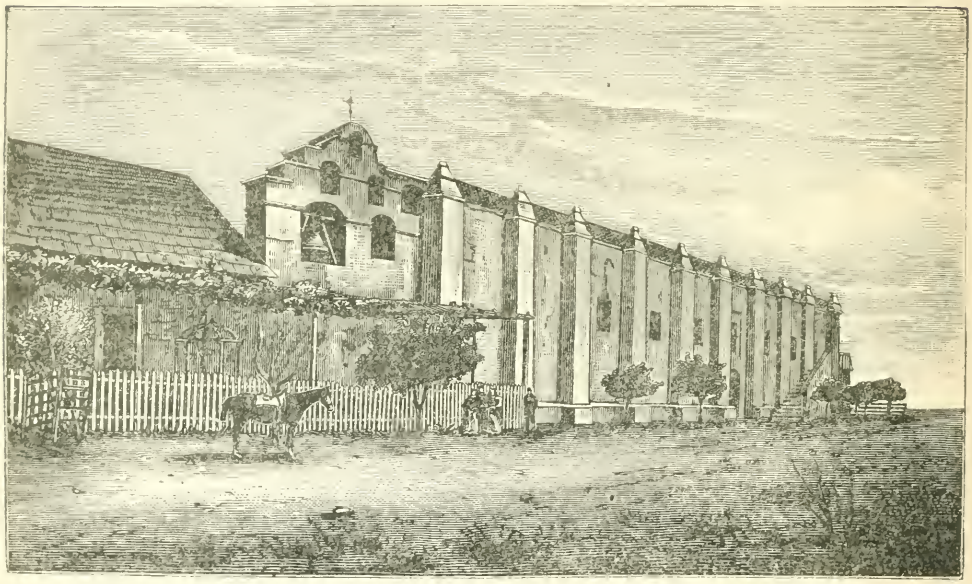
and she had put into her up to five hundred griffins, which as you have been told, she had raised from tender age and fed with the flesh of men, and having therein also put the animals on which they rode and which were of different kinds; also, the best chosen and best armed women which were in the fleet, and leaving such garrison in the island as to be secure, she put to sea with the others, and she hurried so much that she joined the fleets of the pagans the night of the combat, of which you have been told, which caused them all very great pleasure, and then she was visited by those great lords, who showed her great reverence. She wanted to know in what state was their enterprise, begging them to relate it to her minutely; and having heard the report from them, she said: "You have fought this city with your many people and could not take it; well, I with mine, if it is agreeable to you, will on the following day, try the reach of my power, if you will accept my advice." All those great lords answered her, that whatever was by her indicated, they would order it executed. "Then notify at once all the other commanders that to-morrow, on no account, they nor theirs leave their quarters, until it is so ordered by me, and you shall see a fight the most strange never seen before this day, and of which you never have heard spoken." This was then made known to the great Sultan of Liquia and the Sultan of Halapa, who had charge of all the armies which were on land, and who thus ordered their people, wondering much what could be the thought and deed of that Queen.

Thus leaving very little if any doubt that the name "California" had its origin in the fertile brain of Señor Montalvo.

"Then felt I like some watcher of the skies,
When a new planet swims into his ken;
Or like stout Cortez, when with eagle eyes
He stared at the Pacific, and all his men
Looked at each other with a wild surmise—
Silent upon a peak in Darien."

Historical Sketch of the Discovery and Early Occupation of California

It was in the year 1534, during one of these waves of popular enthusiasm which every now and again pass over large communities and inflame the minds of men, that California was discovered. These waves attacking the



OLD MISSION, LOS ANGELES

deepest interest of ambitious men frequently serve to impart an impetus to scientific research in astronomy, chemistry, physics and especially explorations and discoveries of new worlds. To-day as for centuries back explorations and excavations are constantly being pushed ahead. New expeditions are fitted out frequently for polar research and heroes thirsting for fame and the discovery of the open Polar Sea are pushing on with feverish excitement eager to outdo their predecessors. At the close of the fifteenth century the

particular enthusiasm of Spain was the discovery of America. No time was lost in building fleets and sending them out, once Columbus had found the way, to fully explore the new continent and discover the western passage to the Indian seas.

Accordingly we find that Hernando Cortez, fully equipped set sail with his fleet and landed at Vera Cruz in April, 1519. Columbus believed in the Western passage until the day of his death. Cortez, while sailing along the Gulf of Mexico, thought he had found this coveted passage, and when he landed on the eastern coast of Mexico it was believed that Asia had been reached. Later on, however, when he had taken possession of the Aztec Capital, Cortez was convinced that the two continents were not identical, although Mexico was still supposed to be a part of the eastern continent, separated perhaps by a strait or a peninsula which the older explorers had not discovered. This problem the Spanish invader concluded to solve, and the easiest and surest way of accomplishing this was to go to the west seas and follow the western shores northward until the mouth of the strait or Asia itself should be found.

Reaching the western shores of Mexico amid great hardships and many privations, Cortez followed the coast northward until he came to a good harbor. Here he founded the city of Zacatula, about 175 miles north of Acapulco, and commenced building his fleet. Ship-building at best is a tedious undertaking, especially in a new country with hostile natives and the intoxication of conquest to divert one's attention. Still Cortez persevered and in the Spring of 1532 his first ships left Zacatula on their way northward. Hearing nothing from the first expedition, Cortez the next year (1533) sent out two more ships to ascertain the fate of the lost vessels and then push on to Asia. The voyage was supposed to take only a few months under favorable circumstances.

The expeditions of 1533 were under the command of a cousin of Cortez, Diego Becerra de Mendoza and Hernando Grijalva. This latter commandant soon became disheartened and losing faith in the undertaking, returned to Zacatula with his ship. Becerra de Mendoza, however, was made of different stuff and determined to push on with a chivalrous spirit—despite the fact that his crew became mutinous. Being of a haughty disposition he ruled his men with an iron hand, which only added fuel to the fire already kindled. The crew became more and more unmanageable and finally mutinied, with the pilot, Fortuna Jimenez at their head, killing commander Mendoza and putting the officers next in command on the wild shores of Colima to share the fate of their many comrades who had fallen while fighting the savages under Cortez.

Pilot Jimenez now took command of the ship and not caring to meet his fate at the hands of Cortez, pushed up the Mexican coast to find if possible the Asiatic continent and return to Europe. They sailed northward for many months, until one bright morning in the early part of the following year (1534) Jimenez discovered what he supposed to be an island on the western horizon. Bearing down upon it, a good, calm bay was found surrounded by green hills covered with shade trees. Here they decided to put ashore and explore the new country. The vessel was accordingly anchored at a safe distance from the shore and Jimenez with many of his crew took to the boats and landed on a fine sandy beach. No sooner had they landed than the beach swam with huge, dusky savages who overwhelmed the few dozen sailors like an avalanche with such deadly effect that Pilot Jimenez and a score of his faithful followers were slain before the ship could be reached and moved away from the deadly poisoned arrows so fatally wielded by the hostile aborigines.

Thus ingloriously died the discoverer of California, a few short moments after setting his foot upon the Golden

shore, for the supposed island was in reality Lower California and the place of landing was at what is now known as La Paz in the little bay about seventy-five miles north of Cape Palmo on the eastern side of the peninsula and on the western side of the Gulf of California.

The few remaining sailors who succeeded at length in getting their ship under way after several months reached Cortez at Zacatula. After recounting to him the unlucky passage of the vessel and how they had mutinied and killed his cousin Mendoza and how in turn the large coppery savages had killed their pilot and many of the men, Cortez anxiously inquired what the Indians wore and if there were any evidences of richness in their attire. To this the men answered that the natives were well armed with bows and arrows, stone and copper knives etc., and that they wore strings of large pearls around their necks and pieces of bright shining metal, presumably gold, on their persons. This was enough for Cortez to judge of the wealth of the supposed Island, and he at once set to work to refit and get in readiness another expedition. Early in the following year (1535) Cortez set out with a large fleet for Jimenez Bay which he reached May 3rd of the same year. This way was christened Santa Cruz. Here he landed many of his colonists and then explored the coast up and down the Californian and Mexican shores. The Gulf of California was named the Sea of Cortez; it afterwards received the name of Mar Roxa (Red Sea) from the peculiar red color of its waters, arising probably from the discoloration of the Red Colorado (Red River), which emptied into it large volumes of dark red water. Having cruised around this red sea nearly a year, Cortez returned to Santa Cruz to look after his colonists. Here he found many of them killed and the rest suffering from great privation, heartily sick of their new home and begging to be taken away from the hostile aborigines. Accordingly the

CHURCH AND STUDY NEAR DEL MONTE

fleet brought away every European from Santa Cruz in the early part of 1536 and he returned to Zacatula very much discouraged by the experiment.

After resting for a few years Cortez again fitted out a fleet, which started in 1539, commanded by Captain Francisco de Ulloa. This expedition rounded Cape St. Lucas and coasted up the western side of California as high as the Cedros Island off Cape San Eugenio, more than half way up the peninsula coast. It was during this voyage (1539-40) that the name California first appears to have been applied to the peninsula, having undoubtedly been taken from the romance of Montalvo which was published thirty years before.

Everything north of Cape St. Lucas was supposed to be an island or peninsula leading northward to Asia, and to this whole country was applied the name of California.

In 1542, another expedition was fitted out, this time from Navidad, in Mexico, under instructions from the Viceroy of Spain. The command was given to Juan Rodriguez Cabrillo one of the pilots of Cortez. To this man of undoubted courage belongs the honor of discovering Nueva California or Upper California proper. He sailed over the course of Ulloa and pushing on northward, anchored in San Diego Bay, naming it San Miguel.

October 3, 1842, Cabrillo left San Diego with a determination to reach Asia. He sailed northward, touching at the Santa Catalina Island which he found inhabited by natives. Anchoring off San Pedro, he took formal possession of a large Indian town named Xuca, on the coast of Ventura. As he sailed up the coast, dotted here and there with Indian towns, Cabrillo finally reached Monterey Bay, and remained there some time to view the country which pleased him so much. Proceeding northward again he passed Point Reyes, and reached as far north as Cape Mendocino which he named Mendoza, after the

Viceroy of Spain. He then turned southward, discovering the Farallones Islands which he named after his pilot Farallo.

From the records left by Cabrillo there is not the slightest mention made of San Francisco Bay, making it very certain that this daring navigator failed to enter the Golden Gate, for had he done so he would undoubtedly have left us some description of the finest harbor on the Coast.

At this time the Spanish claims in the new world—El Dorado or California, extended from Mexico to the Arctic circle. Colonization was encouraged and attempted from Mexico to San Francisco but not beyond it.

In the mean time England was watching America and especially the Golden West with a jealous eye. Several expeditions were sent out to the Atlantic shores.

In the year 1577 Sir Francis Drake fitted out a ship ostensibly for a buccaneering expedition along the Spanish Main, but Spanish commerce was the objective point of the Spanish Main or anywhere else. Having gathered considerable booty and sacked several newly settled towns along the Spanish coast, Sir Francis desired to head for England by way of the Cape of Good Hope. Destiny foiled this plan. It is just such accidents which play such an important part in the making of history. Drake's vessel got into coast currents and tradewinds which took him so far north that he got into a very cold region. As soon as it became practicable he headed south again and got into latitude 38 degrees, somewhere off the cliffs of Bodega or Drake's Bay. From the whiteness of the cliffs, Drake called the supposed new country New Albion from the resemblance to the coast of England. This was in the year 1578-9. Here Sir Francis landed. He found the Indians going about nearly nude. They were inclined to be peaceable and were desirous he should remain with his "wonder of the sea". The natives offered the "White Chief" their whole country. Drake accepted in the name of Queen

Elizabeth and set up a post with an inscription thereon announcing the discovery and acceptance of this New Albion. He then sailed away.

The exact place of Drake's landing has been a mooted question and caused considerable discussion. Drake's Bay, Bodega Bay and San Francisco Bay, all claim the honor. Drake's Bay is in the same degree of latitude as noted by Sir Francis, and the coast even to-day greatly resembles, both in height and color, the white cliffs seen on the English Channel at Dover and Brighton. Had Bodega been the landing place, surely some description of Tomales Bay would have been made; and had it been San Francisco Bay, which is considerably farther south than 38 degrees north latitude, this clever and daring explorer was not the man to have left without exploring the many arms of this great inland sea, one of the finest harbors in the world. Not one word about the Golden Gate reaches us from the accounts of Drake's expeditions, a fact, taken with others, which goes far to prove that Sir Francis Drake did not even dream of such a bay as that of San Francisco.

Many of the Spanish explorers and vessels both before and after Drake's voyage found Point Reyes, but not one of them say a word about San Francisco Bay.

In 1584 Francisco Gali, sailing a Philippine vessel from Macao and Japan to Acapulco, was taken by the great Oceanic current and tradewinds and carried as far north as Cape Mendocino. Putting about, he succeeded in coasting down to Cape St. Lucas, but discovered nothing new. A few years later, Carmenon, another Philippine commander was commissioned to explore the coast more minutely to find a safe harbor for Spanish vessels. He also passed the Golden Gate without seeing it, although his vessel ran so closely ashore as to founder off Point Reyes.

Philip III of Spain, commissioned Sebastian Vizcaino in 1602 to explore the coast of California; to find a suitable harbor for the Philippian ships, and to hunt for the western

passage to Asia. He arrived at San Diego Bay the following year and changed the name from San Miguel to San Diego. He then proceeded on his voyage up the coast reaching as far north as Point Reyes and Mendocino. His chroniclers noted carefully many ports of the coast and described them in detail but not one word about San Francisco Bay—a further proof that it had never been discovered.

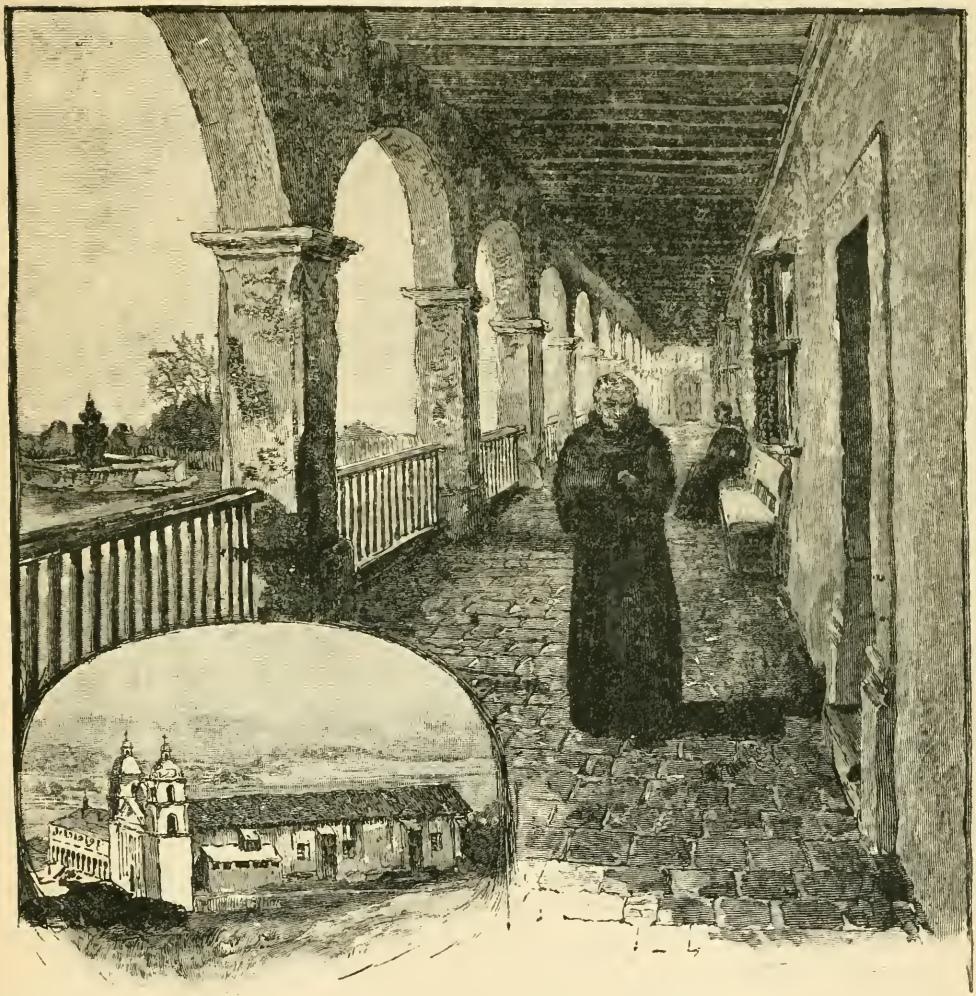
Histories and exaggerated accounts of the exploits of Cortez, Jimenez, Cabrillo, Drake, Carmenon and Vizcaino continued to attract attention and excite the adventurous spirits of another hundred years. Exploring expeditions were sent out under royal charter and under individual patronage to discover and explore this wonderful country whose shores were sands of gold and strewn with pearls of fabulous value. Adventurous spirits headed commands for this new world in 1615, 1633 and half a dozen more up to 1668. Most of them coasted up and down the Pacific shore without discovering anything new. None of them ever entered San Francisco Bay, or if they did so, left no record behind them which they would have been most likely to do, had they entered the Golden Gate.

The Early Mission Fathers

For over one hundred years from 1668 to 1779 slow progress was made in civilizing and colonizing California. Occasional expeditions followed in the track of their predecessors with similar results. Still the highly colored accounts of the rich El Dorado with mountains of gold and shores of pearl, continued to spread and enthuse the adventuresome souls of the age.

In 1677 the Spanish government decided that the Californian conquest and colonization should be undertaken again, this time with more vigor and with the additional aid of the Fathers of the church. Accordingly the Crown

appointed Admiral Don Isidro Ontondo commandant of the expedition. The evangelizing missionaries were selected from the Jesuits, the most powerful spiritual organization in Mexico at that time. The Archbishop of Mexico con-



OLD MISSION CHURCH AT SANTA BARBARA

ferred the honors of leading the evangelizers, on Father Eusebio Francisco Kuhn–a much beloved German priest. Admiral Ontondo was to afford military protection while Father Kuhn and his priests converted the Indians. It

was not, however, until 1683 that the expedition set sail up the Gulf of California and active operations commenced. For two years the brave expedition met with varying success in the Lower California. Many natives were christianized and much good was done.

The Spanish exchequer was not in a particularly flourishing condition at this time, and the court determined that such a heavy drain on its resources could not be maintained as nothing of much value was returned to Spain in exchange for her expensive conquest and evangelizing expedition, and the scheme was deemed impracticable. After a second effort by Ontondo and Kuhn the Spanish government withdrew the expedition and offered the entire control and large grants to the Jesuits if they would continue the projected undertaking. This proposal was not accepted by the Fathers and thus abruptly terminated for a short time the grand undertaking.

Father Kuhn, who had affectionately been called El Padre Kino, was bitterly disappointed at this unexpected turn of affairs, as he had fondly dreamed of the day when his missions would extend over the entire new country. While pondering over the subject Father Kuhn met with a priest as zealous as himself and these two courageous and uniting heroes, in their love and their great enthusiasm for the Catholic faith undertook themselves without means and without support to accomplish what the Spanish Crown had failed to bring to a successful issue. The second hero was Father Salvatierra. Later on Fathers Picolo and Ugarta joined Fathers Kuhn and Salvatierra and the four pioneers set to work with zeal and determination. Almost insurmountable obstacles were overcome and painful hardships endured, and it is pleasing to record that at length success crowned their efforts. The faithful servants established missions in various parts of Lower California.

In 1691 Kuhn explored the Gilda valley and noted the ruins of a once flourishing race. Between 1700 and 1709

Kuhn and his associates discovered that Lower California was not an island but part of the main land. The missions now extended from Cape St. Lucas to San Diego and from the City of Mexico to the Arizona line.

From 1725 to 1760 the Jesuits lost ground in their own dominion. Popular feeling ran high against them–although they had converted the desert and barren country into a veritable oasis. Miners and settlers began to pour into the land of wealth. Hatred was fomented against the priests and secularization assiduously advocated. So much pressure was brought to bear against the pioneer Fathers, that King Charles III of Spain issued an ordinance in 1766 making it imperative for all Jesuits to leave the Spanish dominions. The decree of banishment reached our peninsula in 1768 and they were forced to leave the field of their hardships and toils—the field of their early deprivations and painful though prosperous progress, and California was once again inhabited by aborigines alone.

The Franciscan Friars

During the latter half of the eighteenth century England, France and Spain were much interested in America and their respective colonial possessions. England had succeeded in obtaining the upper hand of France in several engagements which resulted in the great possessions of France in Asia (Hindoostan) and America (Canada) becoming English provinces. England, becoming bold, was looking after further conquests. Spain took warning and, although friendly with England, yet desired to look after her Californian possession.

Shortly after the Jesuit Fathers had been banished, Spain decreed that the Franciscan Friars should take charge of the Peninsula or Lower California missions and also establish missions in Upper or New California as

MISSION SAN MIGUEL—FOUNDED, 1772

rapidly as possible in order to occupy and be in possession of the country should England or France direct attention to the Golden West.

The chief establishment of the Franciscan Monks in New Spain was located at San Fernando, and to it was intrusted the labor of evangelizing the Indians and establishing missions up the coast. The head of this influential convent honored Junipero Serra by selecting him director and head of the California Missions.

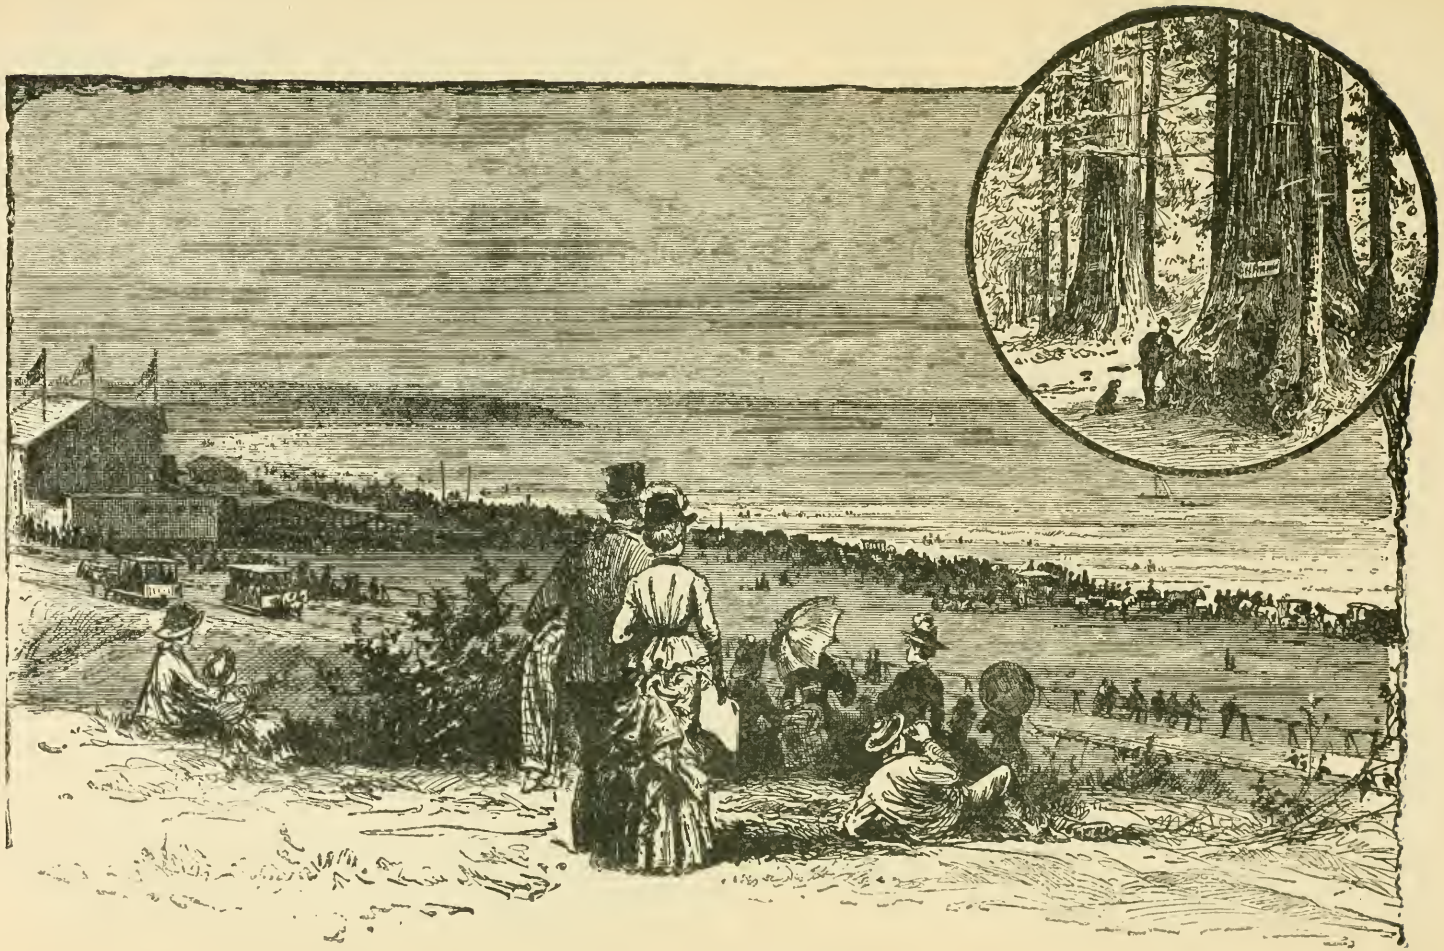
The early history of California is inseparable from that of Friar Serra—a man of superior intellect and fervid religious zeal who had early been ordained and attracted considerable reputation as a preacher. He had spent many years among the Indians of San Luis Potosi and was well fitted to undertake the task. Friar Serra had renounced the world and all its amusements. He found no attraction in woman's society and less in the jovial companionship of his own sex. He was ever serious and never indulged in a smile or jocularity of any kind. His habits were austere and he frequently practised personal chastisement, lashing himself with wire ropes and stones and burning himself with torches. He sought to be a simple, humble, obedient, zealous Friar, without hypocrisy or pride. He made many friends and few enemies and lived as pure a life and did as many noble deeds as has fallen to the lot of any priest before or since.

Early in the year 1769, several expeditions both by land and by sea brought the Fathers of St. Francis to San Miguel (now San Diego). They suffered much and several died from starvation on the trip from Mexico. Shortly after the arrival of Friar Serra active work began, and on July 11, 1769 the first Mission was founded—the Mission of San Diego.

About the same time a small expedition with Portala in command set out for Monterey. With this party were Friars Crespi and Gomez. Onwards they marched and

finally reached the mouth of the Salinas River. The coast by land looked different from what it had been described by sea and our party were not able to discover Monterey Bay. Thinking that perhaps it was still farther north the expedition resolved to push forward. On the last day of October the company reached one of the heights on San Pedro and here halted for recuperation. While camping here, a small expedition under sergeant Ortega set out to explore the coast for a few days. Reaching the shore of the Pacific they tramped along the beach. Arriving at the cliffs opposite Seal Rocks they were unable to go farther on the shore and took to the hills. Ascending the cliffs, not by the well built road and beautiful grounds of Sutro's heights, but up the rough and rugged rocks they climbed. Imagine the amazement with which Ortega gazed on the extensive inland sea and the Golden Gate. This was the first time of which we have any record that San Francisco Bay was seen by European eyes.

During Ortega's absence, all remained quietly in camp excepting a few soldiers who were out hunting for game in the northeastern hills. Having ascended several hundred feet above the surrounding country they too saw the large inland sea. So San Francisco Bay was discovered by the two companies of Portala's expedition about the same time. On receiving the news Portala and Crespi broke camp on the 4th of November 1769 and determined to look at this large sheet of water themselves. They could scarcely believe that it was correct as the many earlier explorers by sea had never even hinted at the existence of such a large body of water and surely it could hardly have escaped their experienced eye. Reaching the San Bruno summits the whole expedition saw what Ortega and the soldiers had simultaneously discovered. The company now retraced their steps to report the discovery of a harbor large enough to contain the whole Spanish fleet, and arrived at San Diego January 24, 1770.



SANTA CRUZ BEACH

April next, two more expeditions, one by sea and the other by land, were sent out to discover Monterey. The *San Antonio* with Father Serra on board sailed April 17, 1770 and reached the harbor of Monterey May 31st. They found the bay just as it had been described over a hundred and fifty years before. The land expedition reached the bay a week preceding. There was a grand jubilee and on the third of June the Mission of San Carlos was founded. The fort of Monterey was established and the whole country was formally occupied and taken possession of in the name of the King of Spain.

Immediately the news of these important discoveries and occupations were sent to Mexico and to Spain. High Masses, congratulations and receptions followed this important extension of the Spanish Crown.

Liberal and extensive provisions were made for the further establishment of missions. Expeditions were fitted out and missions established in rapid succession. The San Antonio Mission was located at the Santa Lucia Mountains July 14, 1771. Another one, that of San Gabriel was founded in August of the same year and located on the San Gabriel River. The San Luis Obispo Mission was founded the following year. In 1776 two missions were founded—one the San Juan Capistrano and the other the Mission Dolores at San Francisco.

From the time Portala's expedition discovered San Francisco Bay in 1769 several exploring companies had been sent out to report on this wonderful sea which had so completely escaped detection. Friar Crespi explored the eastern side of the bay as far north as the Carquinez Straits in 1772. Here he discovered the San Joaquin and the Sacramento Rivers. In 1774 another expedition explored the western shore of the bay as far as the Golden Gate, and in 1775 the ship *San Carlos*, with the *Saint Ayala* entered the Golden Gate—the first time its waters had been disturbed by anything excepting the Indian canoes. In 1776

MONTEREY BATHS

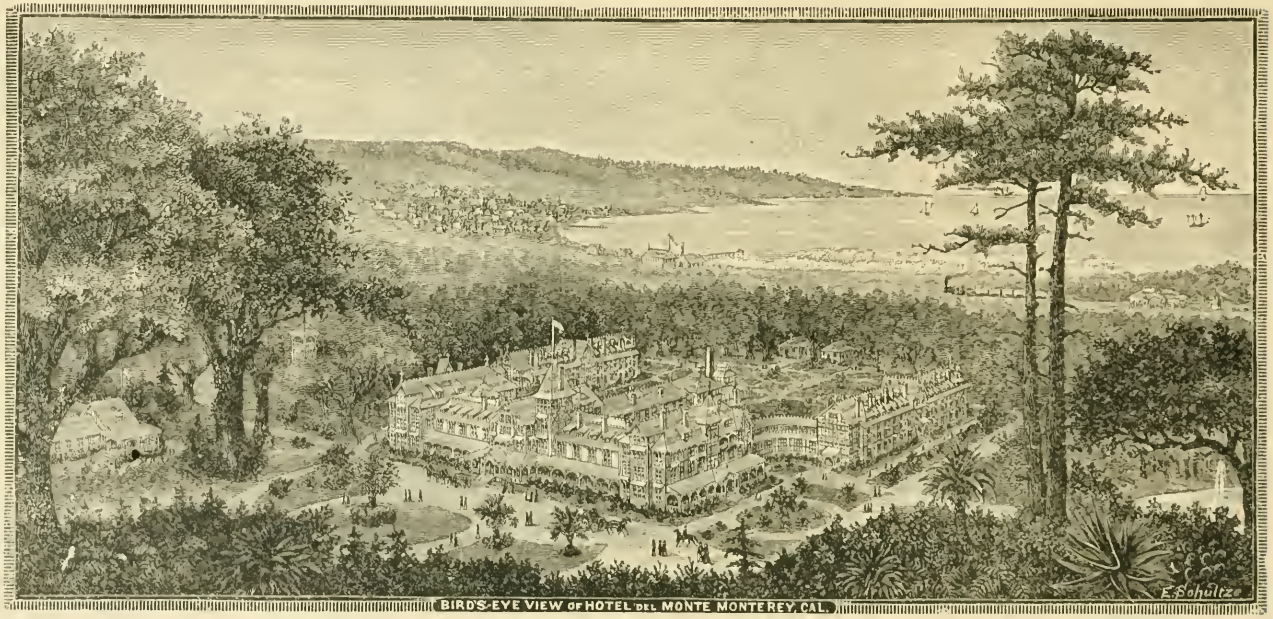
Friars Palou and Cambon with several married civilians and soldiers established the San Francisco Mission. This was the first occupation of San Francisco now 114 years ago. The military and the civilians occupied the presidio whilst the Fathers set to work building the old Mission Church. Many other missions were now being established in several parts of California. Evangelizing the Indians was pushed as rapidly as possible. The country becoming populated and the soil cultivated, herds of cattle and horses and sheep flourished and the golden shores of California were soon made to blossom like the rose. The Missions rapidly prospered and soon became very wealthy and influential, ruling and governing the country for many years.

Within about fifty years, the Franciscan Friars had established twenty-one missions, with large farms and extensive flocks. They were carrying on extensive trade in hides, tallow, wool and wine. They owned about twenty-five to thirty miles of the choicest land around each mission. These "golden days" continued from 1770 to 1822. About this time the Spanish power in Mexico had its downfall and with it the Missions and powers of the Franciscan Fathers commenced to decrease, until finally in 1845 they were formally abolished and their property confiscated.

For several years prior to this confiscation settlers had been constantly increasing. The Mexicans had been attracted by the richness of the soil and the healthfulness of the climate. Trappers and hunters and citizens in delicate health and with adventurous spirits crossed the high Sierras and flocked to California. Between 1840 and 1845 more than 5,000 people had crossed the long plains and scaled the high mountains to make their homes on the shores of the Pacific.

Before the close of 1846 there were 8,000 persons who had come by land and by sea to live in California. From 1822 to 1845 occasional skirmishes and petty wars occurred between settlers in the north and settlers in the south, and

between California residents and Mexican troops. The country continued to prosper and immigration steadily increased. During the war between the United States and Mexico in 1846-8, over 12,000 persons arrived in the State. In 1850, September 9th, the State of California was



admitted into the Union. In February 1848 Marshall discovered the first nugget of gold on the estate of General Sutter in Sonoma County. This was the beginning of the golden era of California.

The news spread like wildfire. In less than four years from this date over 250,000 people were in the State and mining became the universal occupation. With such an enormous immigration, necessarily a large number of outlaws found their way here as well. It was during these stirring times that the noted "Vigilance Committee," composed of some of our best citizens, was obliged to administer justice and restore law and order. From this time on the State of California has increased in population, mineral and agricultural worth more rapidly than any other State in the Union.

"Know'st thou the land where the lemon-trees bloom,
Where the gold orange grows in the deep thicket's gloom,
Where a wind ever soft from the blue heaven blows,
And the groves are of laurel, and myrtle, and rose?"

The Climate of California

"The empire of climate is the most powerful of all empires."

—*Montesquieu.*

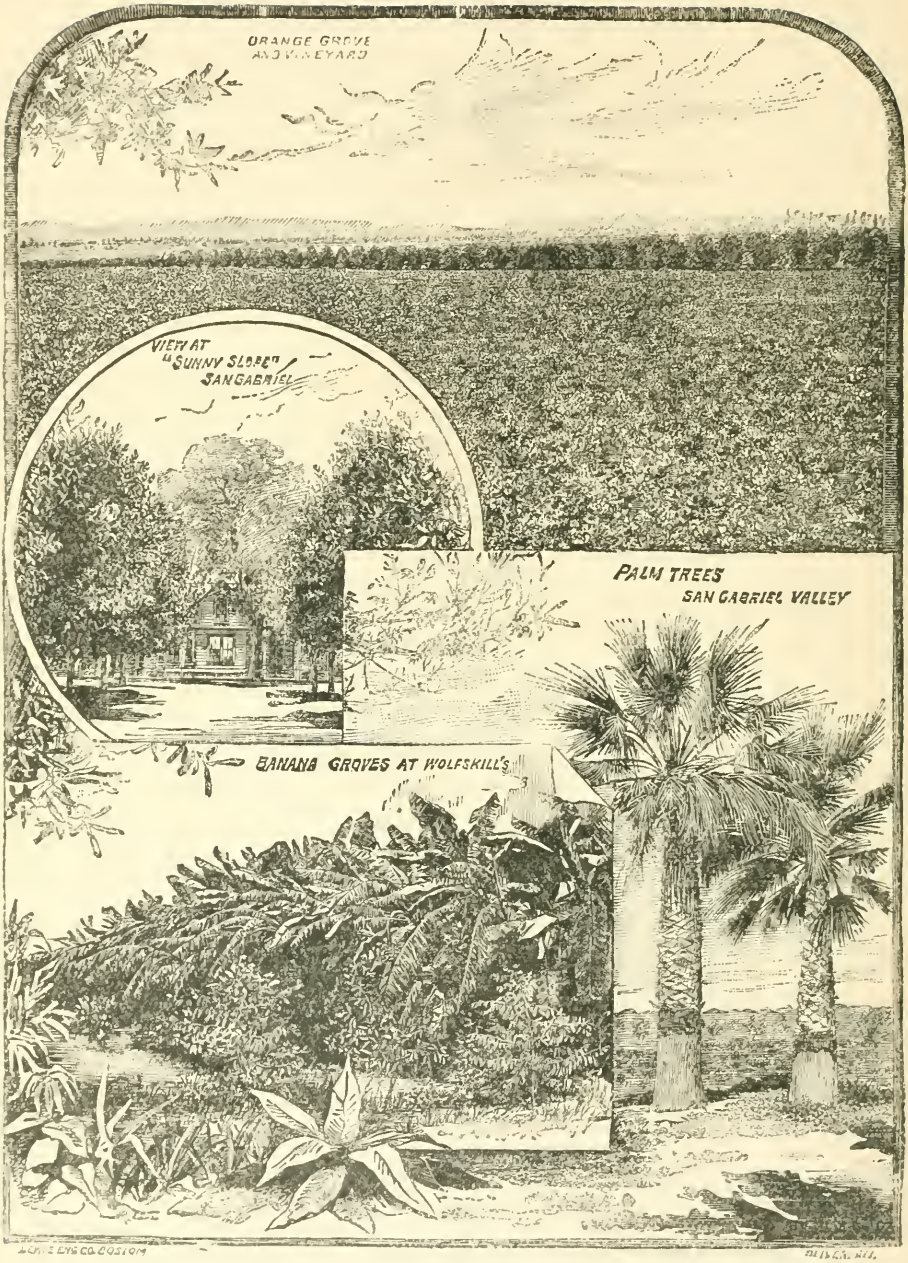
So much has been written regarding the climatic advantages of the Pacific Coast, that I shall confine myself to giving a brief outline of this subject, merely touching upon the most salient points, and then, only as they bear upon the subject of health and health resorts.

The continuous tide of emigration to California is largely the outcome of an effort on the part of Eastern people to escape the rigor that characterizes the climate of the vast extent of country east of the Rocky Mountains. In California the changes from the oppressive heat of Summer to the intense cold of Winter are unknown nor do Californians suffer from the many atmospheric eccentricities that sweep over the Eastern country in the form of blizzards,

cyclones and tornadoes. Even thunder storms are practically unknown here. The configuration of this State, which is nearly 800 miles long and traversed by two mountain ranges, would give rise to the greatest climatic variations were it not for certain modifying influences which do not exist anywhere else in the United States—influences which reduce the differences that would otherwise exist in a range of over sixteen degrees of latitude. Professor Whitney remarks, in his recent work on the United States:

"The causes of this condition of things in the Pacific Coast belt are as follows: The proximity of the great area of water from which the prevailing winds blow toward the land, as will be seen farther on; the modification which the temperature of this ocean undergoes near the American Coast by the Asiatic Coast current and the northern or Arctic Coast current; and the position of the mountain ranges near the coast. The fact that the prevailing winds blow from this great water area toward the land has a powerful influence in bringing about a uniformity of climate along the edges of the land, and this is still further aided by the peculiar nature of the currents along this coast. The influence of the warm Asiatic current, the Kuro-Siwo, is distinctly felt in raising the temperature as far south as the northern border of California; from here south, the cold Arctic current which apparently emerges from under the warm current, makes its presence felt in lowering the temperature along the coast nearly or quite as far south as the southern boundary of the country."

A little farther on he states that "on the California coast the winds are very strong and steady from the northwest in the Summer, but decidedly more to the southwest in Winter. In Summer the intensely heated plateau to the east draws the air from the Pacific, which blows with violence through every depression in the Coast Ranges towards the heated land-mass. There is no 'wind-gap' in the Coast



TYPICAL SOUTHERN CALIFORNIA

Ranges so deeply and widely cut as that of the Golden Gate at San Francisco. At this point the cold winds from the sea find entrance to the Great Valleys of Sacramento and San Joaquin, and the mass of air thus set in motion spreads itself out fan-like after passing through the Gate so that the prevailing winds in those valleys during the Summer are always from the Bay of San Francisco towards the mountains. The hotter the weather in the interior the more violent the wind at San Francisco. But this condition is limited to the daytime. At night the rapid cooling of the higher plateau checks or stops altogether the indraught of air, and an almost entire calm prevails at San Francisco, while the cool air flows in a gentle breeze down the slopes of mountains, in a reverse direction from that which it had during the daytime."

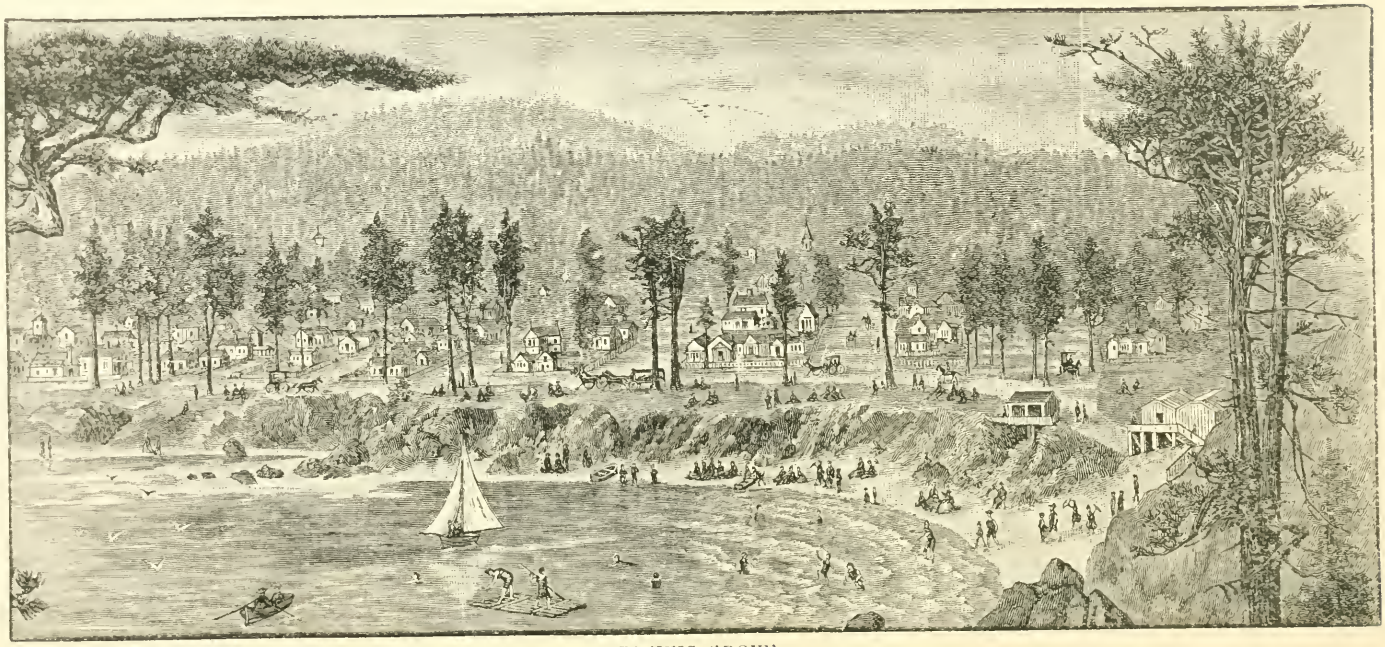
* * *

Velocity of Winds

Protected from the ocean by the Coast Ranges, the air as a rule is dry, so that a degree of heat varying from 95° to 100° F. can be borne with perfect comfort, whereas in the humid atmosphere of the Atlantic Coast this temperature if kept up for any length of time would be insufferable and in many cases fatal. Now this dryness and lightness of atmosphere, relieved by cool dewy nights, gives California a first place among sanitariums, as these two attributes, accompanied by a uniform mean temperature are of prime importance in all lung and throat affections.

A glance at the appended table will satisfy the reader that California is unrivaled as far as uniformity of climate goes, and that it will compare favorably with the most celebrated resorts in the world, either in the United States or abroad.

These refreshing winds begin about the latter part of April, and continue through the Summer months. The velocity varies slightly from year to year. Commencing daily about



PACIFIC GROVE

one or two o'clock P. M. and lasting for two or three hours; the trade-winds blow in a south-easterly direction in the vicinity of San Francisco.

The following table, obtained from the records of the United States Signal Service office, gives the average monthly velocity of the wind in miles during the past three years.

	1886	1887	1888

Rainy Season

While we have two seasons, the dry and the wet, a very general impression regarding the latter needs correcting. Eastern people suppose that when the rains once begin they

are continuous for six months. Rains may begin in October or November and continue for several days. Then we enjoy a period of several weeks when the air is free from dust, the roadbeds are hardened, the vegetation takes a new start, and the sun beams over a land of balmy luxuriance.

The following figures, representing the mean temperature of January and July, and the average annual rainfall (in inches) in Mentone, St. Paul, St. Augustine (Florida), and also in San Diego, Santa Barbara, Los Angeles, and Monterey (California), afford a subject well worthy of consideration.

	TEMPERATURE		
	January Degrees	July Degrees	RAINFALL Inches
San Diego	57	65	10
Santa Barbara	56	66	15
St. Augustine	59	77	55
St. Paul	13	73	30
Mentone	30	69	23
Los Angeles	55	67	18
Monterey	50	65	14

Rainfall

The very finest climate in California will be found near the coast between the 34th parallel and the 38th parallel, taking in Los Angeles, Santa Barbara, Monterey, Santa Cruz and San Francisco. Again taking the center of this region which will be in and around Monterey in latitude 36°, 37′, the following table shows the maximum, minimum and mean temperatures and rainfall for each month during the eight years, as follows:

MONTHS	Temperature for the Month			RAINFALL
	Maximum	Minimum	Mean	
1884				
January	64.00	31.00	49.51	2.60
February	74.00	28.00	50.60	5.34

Localities in the Old World Corresponding in Temperature with Points in California

The following interesting table gives the annual temperature and latitude of corresponding places in the old world.

FROM 44 TO 52 DEGREES

CITY	LOCALITY	Mean Annual Temperature DEGREES	Latitude DEGREES
Carlstad	South-western Sweden	44	59
Dover	South-eastern England	45	43
Dantzig	North-eastern Prussia	46	54
Stromness	Orkney Isles	46	58
Breslau	South-eastern Prussia	46	51
Copenhagen	Denmark	46	55
Dresden	Austria	46	51
Edinburgh	South-eastern Scotland	47	55
Hamburg	Northern Germany	47	53
Dublin	Ireland	49	53
Munich	Bavaria	49	48
Prague	Bohemia	49	50
Leyden	Holland	50	52
Geneva	Switzerland	50	46
Frankfort-on-Main	Germany	50	50

The territory included in 44° to 52° is the higher Coast Ranges and the lower Sierras, the atmosphere of which is dry, pure and invigorating.

The mean Summer temperature is from 50° to 62°.

FROM 52 TO 60 DEGREES

CITY	LOCALITY	Mean Annual Temperature DEGREES	Latitude DEGREES
Turin	Northern Italy	53	45
Milan	Northern Italy	54	45
Toulouse	Southern France	55	43
Venice	North-eastern Italy	57	45
Constantinople	Turkey	57	41
Marseilles	Southeast France	57	43
Bologna	Northern Italy	57	44
Madrid	Central Spain	57	40
Mentone	South-eastern France	57	43
Toulon	Southern France	59	43
Florence	Northern Italy	59	43
Rome	Western Italy	59	41

FROM 60 TO 68 DEGREES

CITY	LOCALITY	Mean Annual Temperature DEGREES	Latitude DEGREES
Nice	South-eastern France	60	43
Naples	South-western Italy	61	40
Lisbon	Portugal	61	38
Barcelonia	North-eastern Spain	63	41
Algiers	Northern Africa	64	36
Gibraltar	Southern Spain	64	36
Smyrna	Western Asia Minor	65	38
Messina	Sicily	66	38

This territory (60° to 68°), extends on the Coast from San Diego to San Pedro at an average width of twenty-five miles, narrowing at the latter point to a few miles and extending north to Point Concepcion, also the valleys of the Sacramento and San Joaquin jointly from Sumner (latitude 35° 24′) to Redding (latitude 40° 37′) varying from forty to fifty miles in width and four hundred and fifty miles in length.

The mean Summer temperature of this region is from 68° to 72°, the mean Winter temperature from 45° to 55°.

FROM 68 TO 72 DEGREES

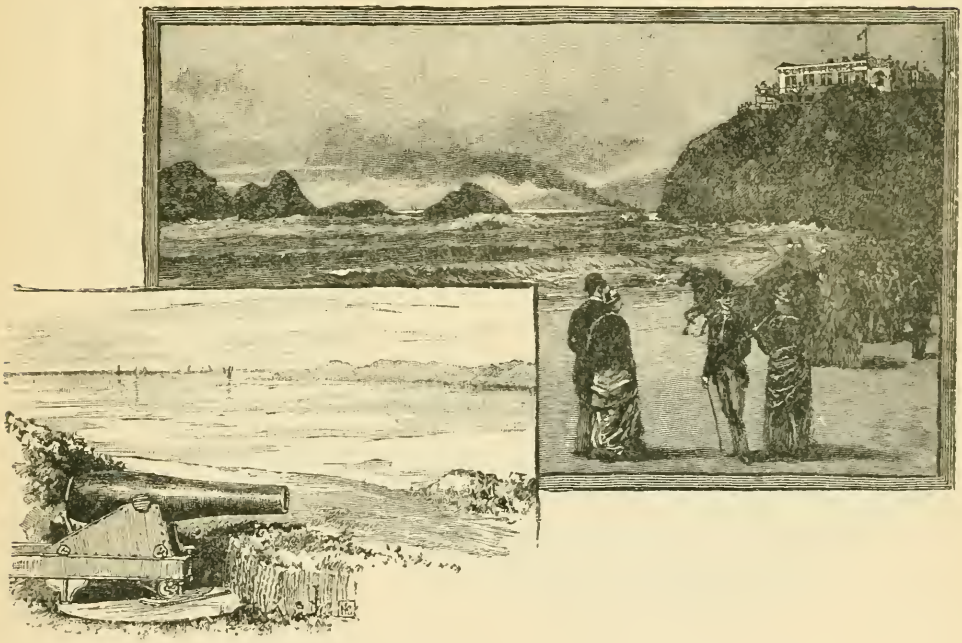
CITY	LOCALITY	Mean Annual Temperature DEGREES	Latitude DEGREES
Tunis	Northern Africa	68	37
Canton	China	69	23
Las Palmas	Canaries	70	28
San Croix	of Teneriffe	71	28
Cairo	Egypt	71	30
Macao	China	72	22

This territory (68° to 72°) extends from Yuma to San Gorgonio along the line of the Southern Pacific Railway, and includes the larger portion of the south-eastern part of the State.

The mean Summer temperature of this region is from 80° to 88° and the mean Winter temperature 55° to 60°.

The territory running from 30° to 44° embraces the high timber Sierras and a portion of the North Coast Range extending from near Clear Lake to Oregon.

The territory running from 52° to 60° extends in a narrow strip along the Coast from near Point Concepcion (latitude 34°) to the Oregon line (latitude 42°). From



CLIFF HOUSE SCENE. SAN FRANCISCO

Point Concepcion in a southerly direction this belt leaves the Coast and trends in a south-easterly direction until near Tehachapi, where it divides, one branch running south to State line, the other running northeast, diminishing at State line in latitude 37°. This region is also represented along the foothills bordering the great valleys of the State, particularly the Sacramento and San Joaquin.

The mean Summer temperature of this territory is from 56° to 68°, and embraces a large number of the health resorts of the State, including nearly all the hot spring regions. Mean Winter temperature, 40° to 52°.

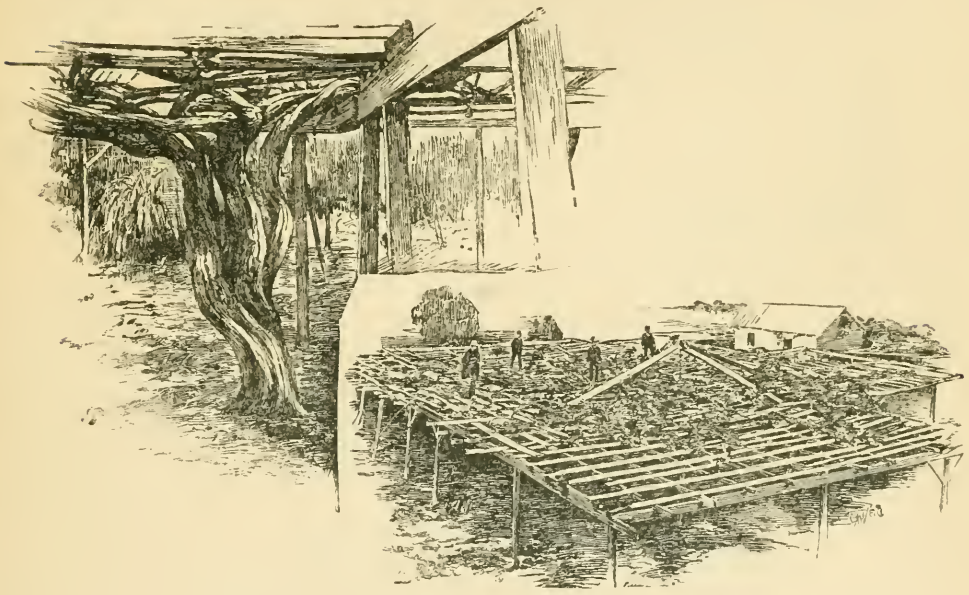
It will be observed from the following extensive monthly schedule that California compares favorably with the most noted health resorts of the world.

San Francisco having 330,000 inhabitants, 16.72 per 1,000 die. In Los Angeles where there are 80,000 people only 8.26 per 1,000 die, and in San Diego with 30,000 population there are only 6 die per 1,000. For the general mortality of 79 towns in California, the average is only 14.88 per 1,000.

Compare the figures with the mortality of the East and Europe.

In Manchester (N. H.)	the mortality is		26.00	per 1,000
" Boston	"	"	23.80	"
" Fitchburg (Mass.)	"	"	29.00	"
" Danburry (Ct.)	"	"	27.30	"
" Albany (N. Y.)	"	"	20.51	"
" Long Island City	"	"	33.71	"
" New York	"	"	23.11	"
" Cleveland (O.)	"	"	23.62	"
" New Orleans	"	"	24.14	"
" Pensacola (Fla.)	"	"	26.40	"
" Raleigh (N. C.)	"	"	26.80	"
" Charleston (S. C.)	"	"	33.10	"
BRITISH AMERICA				
" Galt	"	"	32.00	"
" Hull	"	"	48.00	"
" Montreal	"	"	25.95	"
" London	"	"	18.82	"
" Liverpool	"	"	20.54	"
" Manchester	"	"	29.68	"
" Glasgow (Scotland)	"	"	20.32	"
" Dublin (Ireland)	"	"	22.76	"
EUROPE				
" Genoa	"	"	26.67	"
" Havre	"	"	37.95	"
" Naples	"	"	39.59	"

With perfect sanitation such as we hope will soon be inaugurated in San Francisco, we do not hesitate in saying that the mortality will be reduced to 10 per 1,000 inhabitants. In Los Angeles, San Diego, San Jose, etc., the yearly mortality ranges from 5 to 10 per 1,000. In San Francisco however, many sick and dying people arrive from all over the coast and from the East, making the death-rate greater. But with perfect sewerage and the excellent purifying trade-winds, San Francisco will be one of the healthiest cities in the world.



MONSTER GRAPEVINE AT SANTA BARBARA

To thoroughly appreciate California one should leave the East in January or February; cross the Mississippi Valley where everything is bleak and desolate, and where the northwest wind whistles mournfully around house corners; then cross the broad Western prairies where the only sign of life to be seen is the thin, blue smoke floating upward from the snow-covered housetops; then over grim mountain ranges, dark snowsheds, and over frozen streams,

until the summit of the Sierras is reached, when the promised land gladdens the eye. Here are sunny slopes, budding trees, hills carpeted with wild flowers, throngs of song birds, cloudless blue skies, and life and warmth everywhere. Twenty years ago Bayard Taylor enjoyed this experience, and wrote:

"Then let me purchase a few acres on the lowest slope of these mountains, overlooking the valley, and with a distant gleam of the bay: let me build a cottage embowered in acacia and eucalyptus, and the tall spires of the Italian cypress. Let me leave home when the Christmas holidays are over, and enjoy the balmy Januarys and Februarys, the heavenly Marches and Aprils, of my remaining years here, returning only when May shall have brought beauty to the Atlantic shores. There shall my roses outbloom those of Paestum; there shall my nightingale sing, my orange blossoms sweeten the air, my children play and my best poem be written."

Thy tawney hills shall bleed their purple wine,
Thy valleys yield their oil;
And Music with her eloquence divine,
Persuade thy sons to toil.

Till Hesper, as he trims his silver beam,
No happier land shall see;
And Earth shall find her old Arcadian dream
Restored again in thee!

—*Bayard Taylor.*
